

INTRODUCTION IN THE
USE OF THE CRANMER ABACUS

(DESIGNED FOR USE IN SPECIAL EDUCATION 443
METHODS AND MATERIALS IN TEACHING BLIND CHILDREN)

BACKGROUND ON THE ABACUS AND ITS USE

Most methods of arithmetical calculations used by blind persons are cumbersome and inefficient. Taylor slates, cubarithm boards, and braille writers have all been successfully used by visually handicapped students; but these devices are awkward to carry and use. More significantly, calculating on them is extremely time consuming (Gissoni, 1963). Consequently, the mathematical performance of blind children falls 16-20 percent below the standards for sighted children (Nolan & Morris, 1964).

However, during the last decade, a new method of computation, the use of the Cranmer Abacus for the blind, has been developed, explored, and proved to be a significantly improved method for most visually handicapped students. The Cranmer Abacus is "...generally regarded by competent authorities as the best all-around computing device available to blind people" (Gissoni, 1965, p. 77).

The Cranmer Abacus is a modification of the Japanese abacus, or soroban, as it is called in Japanese. In Japan and other oriental nations the use of the abacus is very widespread. Its popularity in Japan is shown by the fact that it is used for 90 percent of all business arithmetic. The reasons for its popularity are numerous, and they indicate why its use among blind people has been very successful. The Japanese abacus is small, lightweight, and thus very easy to carry. It is inexpensive to buy and costs nothing to maintain. And most important, a skilled operator can achieve a degree of speed and accuracy that will enable him to outperform skilled operators of electric calculators (Gissoni, 1964).

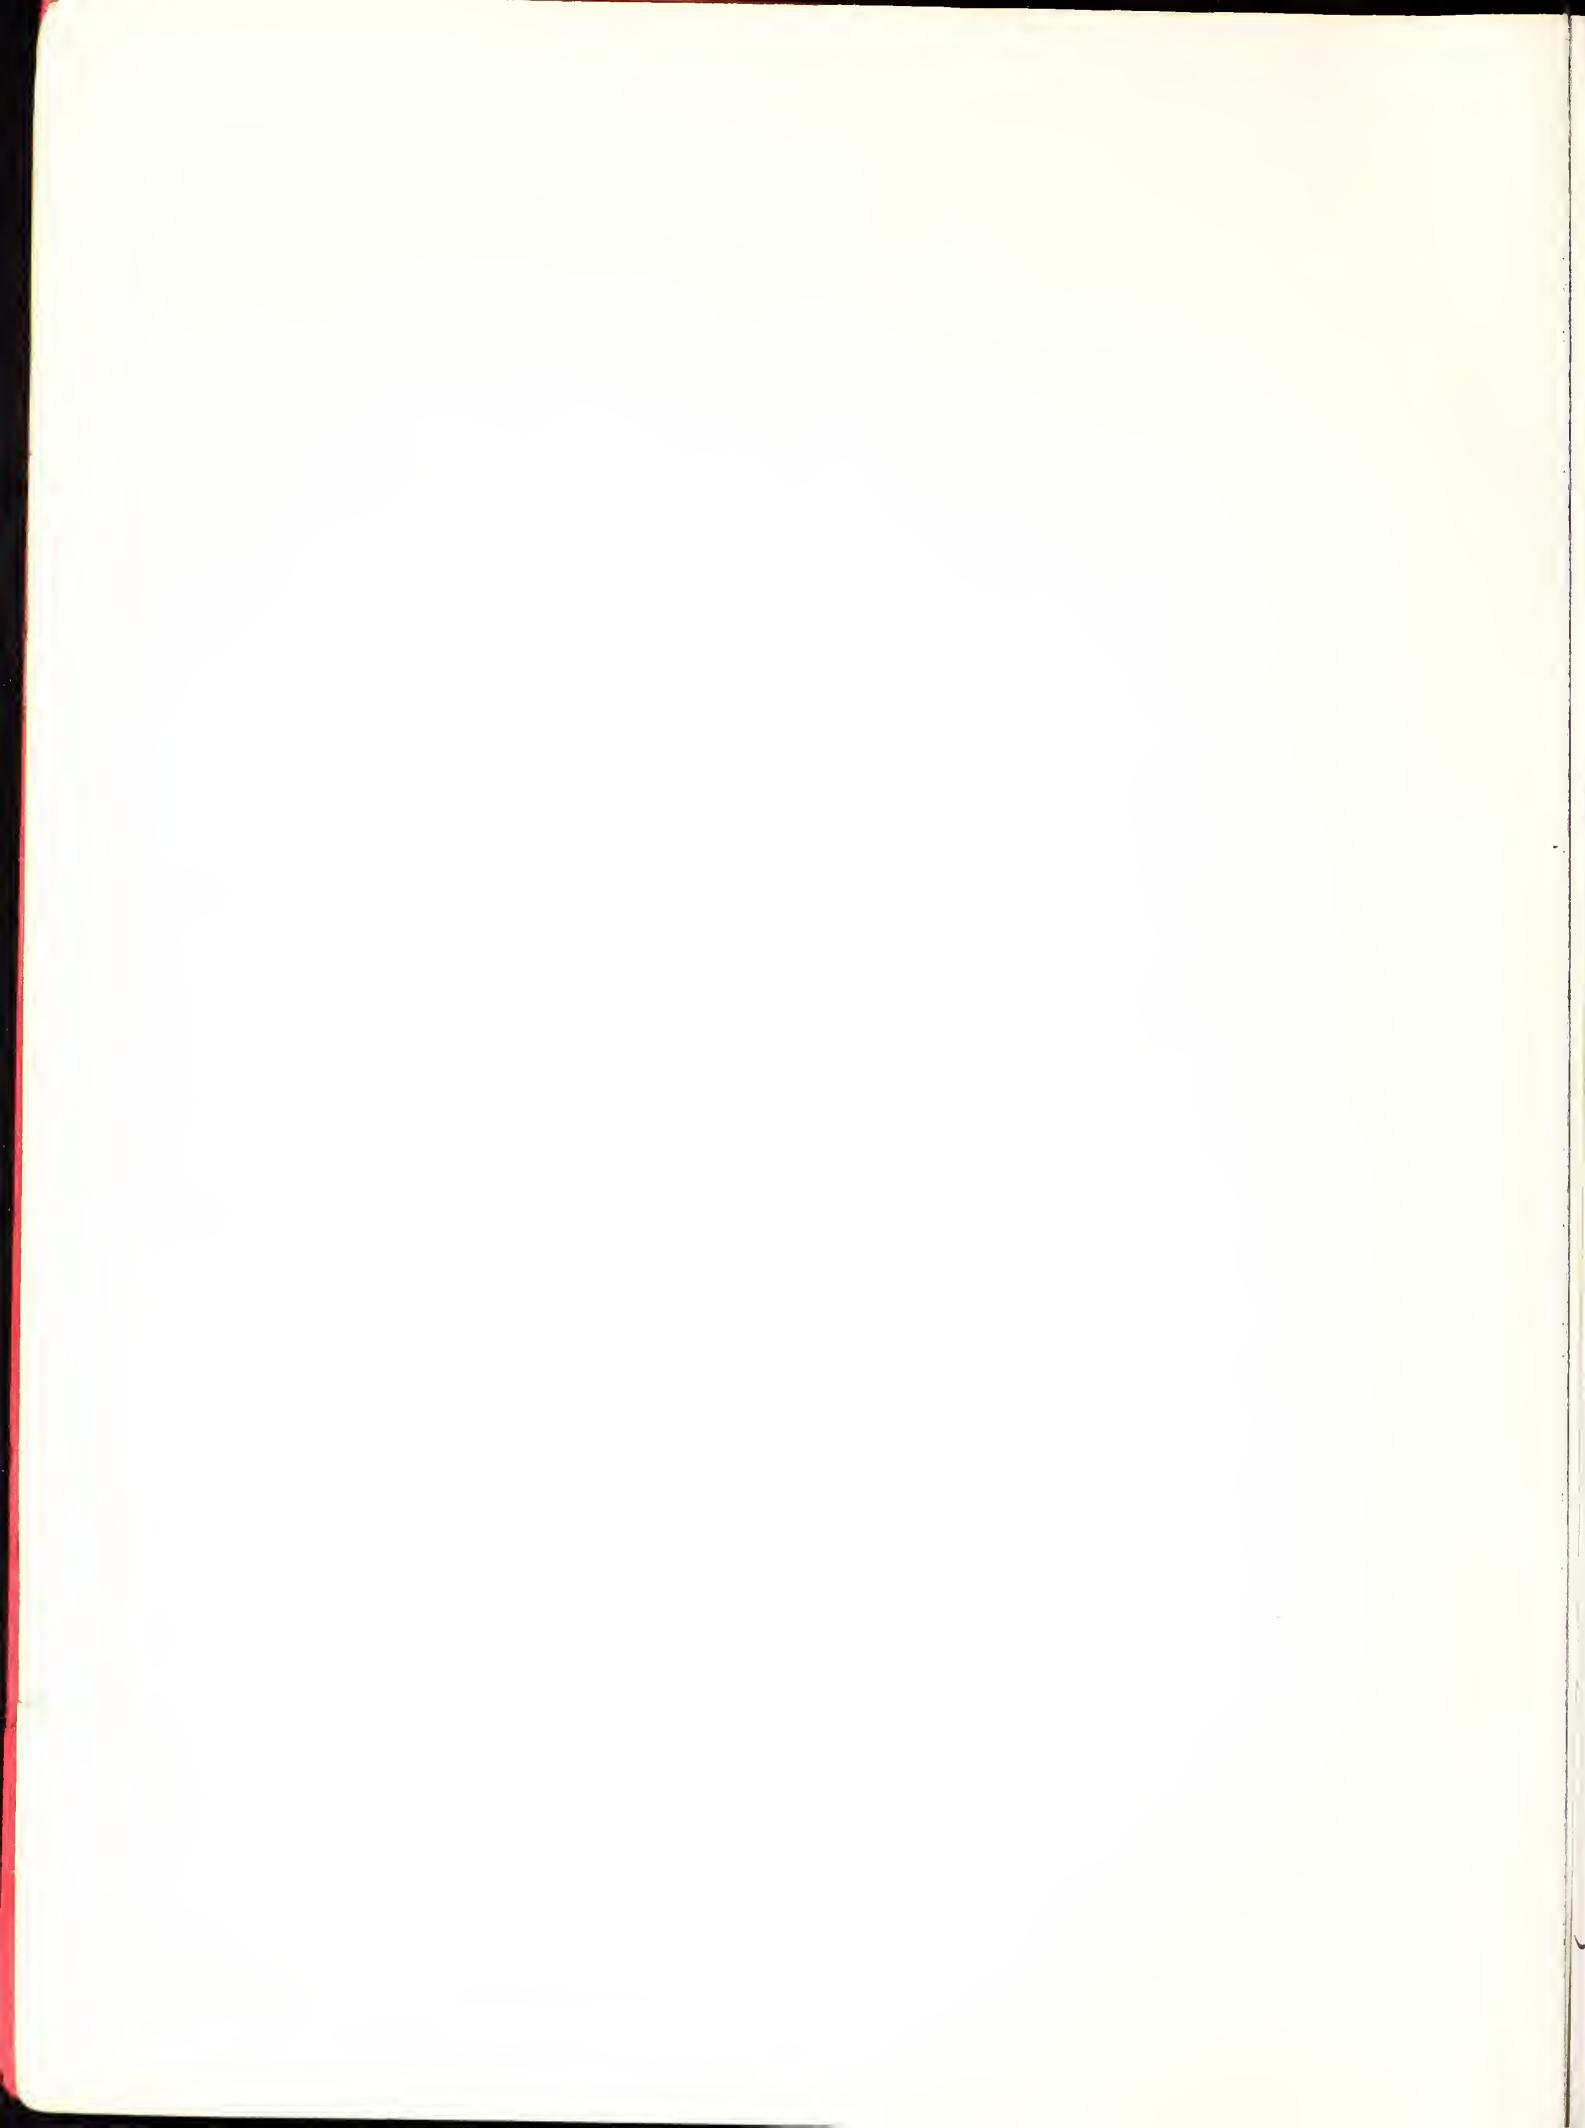

Digitized by the Internet Archive
in 2013

<http://archive.org/details/introductioninus00gayl>

The Cranmer Abacus was developed in 1962 by T. V. Cranmer, Director of the Division of Services for the blind in the Kentucky Department of Education. Mr. Cranmer was very interested in electronics and needed an efficient computational method to help solve his electronic formulas. He attempted to learn the use of the Japanese abacus; but, because he was blind, he found it impossible to work with the soroban counters (beads) which are free to move up and down on the wire columns with no resistance. The slightest touch of a counter caused it to move to an incorrect position. Since a blind person needs to read his answers tactually, this extremely free movement of the counters needed modification (Gissoni, 1964). Thus, Cranmer devised a foam and felt backing to hold the counters more stable; and he increased the length of the wire columns to make the abacus easier to handle and able to be read by touch (Lewis, 1969). Unfortunately, these modifications decrease the speed of computing on the abacus. Nevertheless, a blind operator of the Cranmer Abacus, while not as fast as a skilled operator of the Japanese style, is still able to make arithmetical calculations more quickly and more accurately than a blind student using another method (Nolan & Morris, 1964).

Since the development of the Cranmer Abacus, two separate tests have been written on its use. The first of these by Fred L. Gissoni was Using The Cranmer Abacus For The Blind, published by the American Printing House for the Blind in 1964. It was followed in 1966 by The Abacus Made Easy written by Mae E. Davidow,

and later published by the Printing House, also. I have studied both of these texts as well as a text on the use of the Soroban called The Japanese Abacus Explained by Yozo Yoshino.

Using the knowledge gained from these sources on how to use the abacus, I have written a detailed text for teaching its use to my own visually handicapped students. I have proceeded in a step-by-step manner through the processes of addition, multiplication, subtraction, division, fractional calculation, and the extraction of roots. Each major step is explained and exemplified, and appropriate exercises are given for the student to complete.

ABOUT THE CRANMER ABACUS

The Cranmer Abacus is rectangular in shape measuring 3 x 6 inches and is 3/8 of an inch deep. The frame is plastic with a foam and felt backing. Attached to the frame are thirteen vertical wire rods or columns, each holding 5 counters or beads. Running the length of the frame is a horizontal bar which cuts across all thirteen columns and separates the top counter on each column from the remaining four. This bar is named the separation bar. On this bar, and also along the bottom of the frame there are single dots indicating the position of the columns. Also, from right to left, after every third column there is a line called a unit mark which marks the comma locations, and, in some cases, the decimal locations.

The abacus should generally be placed on a table or desk in front of the operator and left resting on that surface during its use. The single counters above the separation bar are called heaven counters and each of them equals five. The four counters below the separation bar on each column are called earth counters, and each of them is equal to one. When a counter is moved close to the bar, it takes on its assigned value (i.e. heaven = 5 each, earth = 1 each) when moved away from the bar it has no value. When we move a counter toward the bar, thus giving it value, we say we set it. On the other hand, when we move a counter away from the bar we say we clear it. When we say "set one left" or "clear one left" we mean to set or clear one on the column immediately to the left.

The column farthest right on the abacus is the units column, the next column left is the tens, then hundreds, and so on up to the thirteenth column which is trillions.

Before proceeding, be certain that you understand all of the terms explained above. The following checklist will help you:

| | |
|----------------|-----------------|
| column | set |
| counter | clear |
| separation bar | set left |
| unit mark | units column |
| heaven counter | tens column |
| earth counter | millions column |

SETTING NUMBERS

We will begin our study of the use of the abacus by setting and clearing several numbers. Throughout this text you must pay careful attention to which finger is used for each movement. Doing so will help you attain the greatest speed possible. In most cases all setting and clearing will be done with the right hand. The left forefinger should rest on the column just to the left of the column being used - its function is to help you keep your position on the proper column.

Set 1 - Raise 1 earth counter on the units column with the thumb.

Clear 1 - Push down 1 earth counter on the units column with the right forefinger.

Set 2 - Raise 2 earth counters on the units column with the thumb.

Clear 2 - Push down 2 earth counters on the units column with the right forefinger.

Set 5 - Push down 1 heaven counter on the units column with the right forefinger.

Clear 5 - Push up 1 heaven counter on the units column with the right forefinger.

Set 6 - On the unit column, with one movement, push down 1 heaven counter with the forefinger and raise 1 earth counter with the thumb.

Clear 6 - On the unit column, push up 1 heaven counter with the forefinger; then push down 1 earth counter with the forefinger.

Set 8 - On the unit column, with one movement, push down 1 heaven counter with the forefinger and raise 3 earth counters with the thumb.

Clear 8 - On the unit column, push up 1 heaven counter with the forefinger; then push down 3 earth counters with the forefinger.

Set 10 - On the ten's column, raise 1 earth counter with the thumb.

Clear 10 - On the ten's column, push down 1 earth counter with the thumb.

Set 11 - On the ten's column, set 1 with the thumb.

On the unit's column, set 1 with the thumb.

Clear 11 - On the ten's column, clear 1 with the forefinger.

On the unit's column, clear 1 with the forefinger.

Set 37 - On the ten's column, set 3.

On the unit's column, set 7.

Clear 37 - On the ten's column, clear 3.

On the unit's column, clear 7.

Set 7,562 - On the thousand's column, set 7

On the hundred's column, set 5

On the ten's column, set 6

On the unit's column, set 2

Clear 7,562 - On the thousand's column, clear 7

On the hundred's column, clear 5

On the ten's column, clear 6

On the unit's column, clear 2

Practice setting many numbers (zip codes, telephone numbers, street numbers, class size, age birth years). Always set heaven counters with the right forefinger, and set earth counters with the right thumb. Clear both heaven and earth counters with the right forefinger. Use the left forefinger for positioning.

ADDITION

DIRECT ADDITION

Now that you have learned to set and clear numbers on the abacus, we are ready to begin the study of addition. Each number 1-9 can be added by one of three ways except the number 5 which has only two possible ways. The easiest method is that of Direct Addition, and we will study it first. Study carefully the examples below.

$$1 + 1 = 2$$

Raise an earth counter on the units column with the thumb

Raise another earth counter on the units column with the thumb;

The sum, 2, is indicated.

$$2 + 2 = 4$$

Raise two earth counters on the units column with the thumb

Raise two more earth counters on the units column with the thumb;

The sum, 4, is indicated.

$$1 + 5 = 6$$

Raise an earth counter on the units column with the thumb

Slide down a heaven counter on the units column with the forefinger;

The sum, 6, is indicated.

$$1 + 6 = 7$$

Raise an earth counter on the units column with the thumb

On the units column, with one movement, slide down a heaven counter with the forefinger and raise an earth counter with the thumb;

The sum, 7, is indicated.

$$2 + 7 = 9$$

Raise two earth counters on the units column with the thumb.

On the units column, with one movement, slide down a heaven counter with the forefinger and raise two earth counters with the thumb;

The sum, 9, is indicated.

When adding numbers of two or more digits, always start on the column farthest left and work to the right.

$$11 + 22 = 33$$

On the tens column, raise one earth counter with the thumb.

On the units column, raise one earth counter with the thumb.

On the tens column, raise two earth counters with the thumb.

On the units column, raise two earth counters with the thumb.

The sum, 33, is indicated.

$$52 + 27 = 79$$

On the tens column, slide down the heaven counter with the forefinger.

On the units column, raise two earth counters with the thumb.

On the tens column, raise two earth counters with the thumb.

On the units column, with one movement, slide down the heaven counter with the forefinger and raise two earth counters with the thumb.

The sum, 79, is indicated.

The examples above demonstrate the proper use of fingers in setting various numbers. The following problems will give you practice in direct addition. Careful attention should be paid to proper finger usage and left-to-right process.

SECRETS

Unfortunately, addition is not always direct. When we cannot add a number 1-9 directly, we must use a secret, or that is, a different process for adding that number. Each number 1-9 has two secrets except the number 5 which has only one. The secrets are listed below.

| <u>To Add</u> | <u>Secrets</u> |
|---------------|----------------------------|
| 1 | Set 5, Clear 4 ✓ |
| 1 | Clear 9, Set 1 left ↗ |
| 2 | Set 5, Clear 3 |
| 2 | Clear 8, Set 1 left ✓ |
| 3 | Set 5, Clear 2 |
| 3 | Clear 7, Set 1 left ✓ |
| 4 | Set 5, Clear 1 ✓ |
| 4 | Clear 6, Set 1 left ✓ |
| 5 | Clear 5, Set 1 left ↗ |
| 6 | Set 1, Clear 5, Set 1 left |
| 6 | Clear 4, Set 1 left |
| 7 | Set 2, Clear 5, Set 1 left |
| 7 | Clear 3, Set 1 left |
| 8 | Set 3, Clear 5, Set 1 left |
| 8 | Clear 2, Set 1 left |
| 9 | Set 4, Clear 5, Set 1 left |
| 9 | Clear 1, Set 1 left |

To gain skill and speed on the abacus, you must practice setting the secrets above until setting them becomes automatic. We will study the secrets for each number separately at first. On the pages ahead you will find many problems that you are to work for practice. Some of you will not need to work all of them, but there is no substitute for repetitive practice to develop skill and speed. The more problems you work, the better you will become.

SECRETS FOR ADDING ONE

Study and memorize the secrets for adding 1

Set 5, Clear 4

Clear 9, Set 1 left

For practice, add 1, plus 1, plus 1, plus 1, etc. until you feel confident in your use of the secrets. Follow the procedure outlined below to establish the proper finger usage.

On the units column, raise one earth counter with the thumb.

On the units column, raise one earth counter with the thumb.

On the units column, raise one earth counter with the thumb.

On the units column, raise one earth counter with the thumb.

On the units column, slide down the heaven counter with the forefinger. Continue using the forefinger to clear the four earth counters. (Set 5, Clear 4)

On the units column, raise one earth counter with the thumb.

On the units column, raise one earth counter with the thumb.

On the units column, raise one earth counter with the thumb.

On the units column, raise one earth counter with the thumb.

On the units column, clear the heaven counter with the forefinger. Clear, the four earth counters with the forefinger and simultaneously, on the tens column, set an earth counter with the thumb. (Clear 9, Set 1 left).

On the units column set one earth counter with the thumb.

Continue on in this manner. When you reach 49, to add one, you must again clear 9, set 1 left. Because you cannot set 1 left directly on the tens column, you must therefore set 5, clear 4.

When you reach 99, to add one, you must again clear 9, set 1 left. Because you cannot set 1 left directly on the tens column, you must also clear 9, set 1 left on that column.

Continue practicing in this manner until the secrets for adding 1 become automatic reactions. For some of you this will mean adding until you reach 100. Others will have to reach a much higher sum. When you feel confident in your use of these secrets, work the following problems. Remember to use your fingers correctly and always to work from left to right.

SECRETS FOR ADDING TWO

Next we will study the secrets for adding 2.

Set 5, Clear 3

Clear 8, Set 1 left

For practice add 2, plus 2, plus 2, plus 2, etc. Follow the same pattern of finger usage as described for adding 1, plus 1, plus 1. Continue practicing until the secrets for adding two become automatic. Then work the following problems.

$$\begin{array}{cccccc}
 111,111,111,111 & 333,333,333,333 & 444,444,444,444 & 666,666,666,666 \\

SECRETS FOR ADDING THREE

Now study the secrets for adding 3.

Set 5, Clear 2

Clear 7, Set 1 left

For practice add 3, plus 3, plus 3, plus 3, etc. Follow the same pattern for finger usage as described in 1, plus 1, plus 1 etc. Continue practicing until the secrets for adding three become automatic. Then practice these problems.

SECRETS FOR ADDING FIVE

Now study the secret for adding 5.

Clear 5, Set 1 left

For practice, add 5, plus 5, plus 5, plus 5, etc. Follow the following procedure carefully to establish the proper finger usage:

5 On the units column, set the heaven counter with the forefinger.

+5 With one movement, clear the heaven counter with the forefinger (clear 5) and on the tens column, set 1 earth counter with the thumb. (Set 1 left).

+5 Repeat Step #1, etc.

SECRETS FOR ADDING SIX

Now study the secrets for adding 6.

Set 1, Clear 5, Set 1 left

Clear 4, Set 1 left

For practice, add 6, plus 6, plus 6, plus 6, etc. Follow the following procedure to establish proper finger usage.

6 - On the units column, with one movement, set the heaven counter with the forefinger and set 1 earth counter with the thumb (set 6)

+6 - On the units column, set 1 earth counter with the thumb.

With one movement clear the heaven counter on the units column with the forefinger and set 1 earth counter on the tens column with the thumb. (Set 1, Clear 5, Set 1 left)

+6 - On the units column, with one movement, set the heaven counter with the forefinger and 1 earth counter with the thumb. (Set 6)

+6 - Set 1, Clear 5, Set 1 left.

+6 - With one movement, clear 4 earth counters on the units column with the forefinger and set 1 earth counter on the tens column with the thumb. (Clear 4, Set 1 left)

+6 - Set 6

+6 - Set 1, Clear 5, Set 1 left

+6 - Set 1, Clear 5, Set 1 left (To set 1 left here, you must set 5, clear 4 on the tens column.)

+6 - Clear 4, Set 1 left.

Another good exercise for practice in all the secrets of addition is to add:

$$\begin{array}{rcl} 1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 & = & 45 \\ 9 + 8 + 7 + 6 + 5 + 4 + 3 + 2 + 1 & = & 45 \end{array}$$

$$\begin{array}{rcl} 1 + 1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 & = & 46 \\ 1 + 9 + 8 + 7 + 6 + 5 + 4 + 3 + 2 + 1 & = & 46 \end{array}$$

$$\begin{array}{rcl} 2 + 1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 & = & 47 \\ 2 + 9 + 8 + 7 + 6 + 5 + 4 + 3 + 2 + 1 & = & 47 \end{array}$$

$$\begin{array}{rcl} 3 + 1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 & = & 48 \\ 3 + 9 + 8 + 7 + 6 + 5 + 4 + 3 + 2 + 1 & = & 48 \end{array}$$

$$\begin{array}{rcl} 4 + 1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 & = & 49 \\ 4 + 9 + 8 + 7 + 6 + 5 + 4 + 3 + 2 + 1 & = & 49 \end{array}$$

$$\begin{array}{rcl} 5 + 1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 & = & 50 \\ 5 + 9 + 8 + 7 + 6 + 5 + 4 + 3 + 2 + 1 & = & 50 \end{array}$$

$$\begin{array}{rcl} 6 + 1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 & = & 51 \\ 6 + 9 + 8 + 7 + 6 + 5 + 4 + 3 + 2 + 1 & = & 51 \end{array}$$

$$\begin{array}{rcl} 7 + 1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 & = & 52 \\ 7 + 9 + 8 + 7 + 6 + 5 + 4 + 3 + 2 + 1 & = & 52 \end{array}$$

$$\begin{array}{rcl} 8 + 1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 & = & 53 \\ 8 + 9 + 8 + 7 + 6 + 5 + 4 + 3 + 2 + 1 & = & 53 \end{array}$$

$$\begin{array}{rcl} 9 + 1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 & = & 54 \\ 9 + 9 + 8 + 7 + 6 + 5 + 4 + 3 + 2 + 1 & = & 54 \end{array}$$

Next add each of the following problems several times. Have someone read you the numbers as fast as you are able to add them, and try each time to complete the problem more quickly while still obtaining the correct sum.

| | | | | | | |
|------------|-----------|------------|------------|------------|-------------|------------|
| 16 | 31 | 68 | 75 | 87 | 189 | 795 |

ADDITION OF DECIMALS

The same secrets are used in the addition of decimals as are used in the addition of whole numbers. There is, however, a specific procedure for determining proper placement of decimal numbers on the abacus that was not necessary for placing whole numbers.

1. First, find which addend (number being added) has the most decimal places.
2. If the largest number of decimal places is three or less, use the first unit mark from the right as the decimal place (thus such numbers as 47.2, 6.75, 6.734, 94.86, 345.1, would use the first unit mark as the decimal point).
3. If the largest number of decimal places is four, five, six, use the second unit mark from the right as the decimal point.

(Thus numbers such as 63.0064, 7.12876, 786,389576, 4.672571, would use the second unit mark as the decimal point.)

4. If the largest number of decimal places is seven, eight, or nine use the third unit mark from the right as the decimal point.

(Thus, numbers such as 64.7443861, 1.758436612, 834.687435981 would use the third unit mark as the decimal point.)

Once you have determined which unit mark will be used as the decimal point, you need only remember to set each addend on the abacus so that the decimal point is positioned properly. The actual addition uses the same secrets which you have already mastered. Study the examples below.

Example #1

$$6.07 + 13.9 + 65.743$$

Largest number of decimal places is three - first unit mark is decimal point.

6.07 Set so that 6 is on column immediately to left of first unit mark.

13.9 Set so that 3 is on column immediately to left of first unit mark.

65.743 Set so that 5 is on column immediately to left of first unit mark.

85.713 Is the final sum - 5 is on colum immediately to left of first unit mark.

Example #2

$$7.5 + 879.4 + 62.46$$

Largest number of decimal places is two - first unit mark is decimal point.

7.5 Set so that 7 is on column immediately to left of first unit mark.

579.4 Set so that 9 is on column immediately to left of first unit mark.

62.46 Set so that 2 is on column immediately to left of first unit mark.

649.360 Is the sum - 9 is on column immediately to left of first unit mark. (The zero here has no significance since it does not serve as a place holder as in 4.07, 4.6009. Therefore it can either be recorded or omitted.

Example #3

$$84.035 + 78.7 + 98.6974 =$$

Largest number of decimal places is four - second unit mark is decimal point.

84.035 Is set so that 4 is on column immediately to left of second unit mark.

78.7 Is set so that 8 is on column immediately to left of second unit mark.

98.6974 Is set so that 8 is on column immediately to left of second unit mark.

261.4324 Is the sum - 1 is on column immediately to left of second unit mark.

Example #4

$$7.4798368 + .00976583 + .052 =$$

Largest number of decimal is 8 - third unit mark is decimal place.

7.4698368 Is set so that 7 is on column immediately to left of third unit mark.

.00976583 Is set so that 9 is on third column to right of third unit mark.

.052 Is set so that 5 is one second column to right of third unit mark.

7.53160263 Is the final sum - 7 is on column immediately to left of third unit mark.

Do the following problems for practice in adding decimals.

$$\begin{array}{r}
 6.07 \quad 4.653 \quad 342.4 \quad 68.1 \quad 6.819 \quad 3.478 \\

 \end{array}$$

MULTIPLICATION

As in multiplication on paper, a student using the abacus must have mastered the multiplication tables. The student who is just learning these tables can, of course, practice them on the abacus to attain perfection. He cannot, however, proceed further into this discussion of multiplication until he knows his tables completely.

In the multiplication problem, each part has a name; the number being multiplied is the multiplicand. The number doing the multiplying is the multiplier, and the answer is called the product. It is essential that you learn these names since they will be used throughout our explanation of multiplication.

Before we can begin to multiply, we must first set the multiplier and the multiplicand on the proper columns of the abacus. It is very important that they be located correctly so that the last digit of the product will always fall on the last column to the right of the abacus. Knowing which column is the last one in the product is necessary when the last digit is zero.

The multiplier is easy to locate. It is set on the columns farthest left on your abacus. To determine where to set the multiplicand, we first add the number of digits in the multiplier plus the number of digits in the multiplicand plus one. That sum is the number of the column (counting from the right) where the first digit of the multiplicand is set, the remaining digits being set in order to the right. For instance, in the problem $6 \times 9 = ?$, we set the

multiplier (6) on the column farthest left. We add the number of digits in the multiplier (1) plus the number of digits in the multiplicand (1) plus 1. The sum is 3. Thus the first digit of the multiplicand is set on the third column from the right. If the multiplier has two digits and the multiplicand three, then the first digit on the multiplicand is set on the 6th column from the right ($2 + 3 + 1 = 6$).

Practice setting these problems. Do not try to work them.

| | | | |
|-----------------|-------------------|---------------------|---------------------|
| $6 \times 7 =$ | $4 \times 10 =$ | $179 \times 34 =$ | $20 \times 8000 =$ |
| $4 \times 8 =$ | $17 \times 90 =$ | $1874 \times 685 =$ | $7 \times 12050 =$ |
| $9 \times 3 =$ | $28 \times 4 =$ | $204 \times 691 =$ | $18 \times 4187 =$ |
| $12 \times 9 =$ | $380 \times 25 =$ | $71 \times 4 =$ | $940 \times 6800 =$ |
| $47 \times 2 =$ | $650 \times 1 =$ | $80 \times 704 =$ | $2 \times 4 =$ |
| $6 \times 28 =$ | $27 \times 38 =$ | $67 \times 400 =$ | $6801 \times 420 =$ |
| $5 \times 74 =$ | $69 \times 480 =$ | $7 \times 1700 =$ | $800 \times 6000 =$ |

POSITION CONCEPT

When multiplying on the abacus, it is essential that we understand the position concept. We already know that there are thirteen columns on the abacus. A position consists of two adjacent columns. Which two columns comprise the first position depends upon the location of the multiplicand. The first position is always the first two columns after the multiplicand, regardless of where those two columns are on the abacus. The second position is always columns 2 + 3 to the right of the multiplicand. Notice that the positions overlap; column 2 is the last column of the first position, and the first

column of the second position. It follows that the third position is columns 3 and 4 to the right of the multiplicand, the eighth position is columns 8 and 9 and the fourteenth is columns 14 and 15.

Name which columns make up these positions.

| | |
|--------------------|--|
| Sixth position | - Columns 6 and 7 to right of multiplicand |
| Fourth position | - Columns 4 and 5 to right of multiplicand |
| Eleventh position | - Columns 11 and 12 to right of multiplicand |
| First position | - Columns 1 and 2 to right of multiplicand |
| Ninth position | - Columns 9 and 10 to right of multiplicand |
| Third position | - Columns 3 and 4 to right of multiplicand |
| Sixteenth position | - Columns 16 and 17 to right of multiplicand |
| Second position | - Columns 2 and 3 to right of multiplicand |

ONE-DIGIT MULTIPLIER TIMES ONE-DIGIT MULTPLICAND

We are now ready to consider multiplications having one-digit multipliers and one-digit multiplicands. Review how to determine where to set the multiplicand. The product of the first multiplication in any problem is set in the first position (i.e. columns 1 and 2 to the right of the multiplicand.) The following problems will all result in two-digit products, and thus will use both columns of the first position.

$$6 \times 3 = 18$$

$$9 \times 2 = 18$$

$$5 \times 8 = 40$$

$$6 \times 4 = 24$$

$$4 \times 7 = 28$$

$$4 \times 5 = 20$$

$$9 \times 5 = 45$$

$$8 \times 6 = 48$$

$$5 \times 7 = 35$$

$$3 \times 7 = 21$$

$$6 \times 8 = 48$$

$$6 \times 5 = 30$$

$$8 \times 4 = 32$$

$$6 \times 6 = 36$$

$$9 \times 9 = 81$$

$$7 \times 8 = 56$$

In the following exercises, the products are one-digit numbers.

One-digit products are always set on the second column of the position.

Work these problems.

$$2 \times 3 = 6$$

$$2 \times 4 = 8$$

$$2 \times 2 = 4$$

$$9 \times 1 = 9$$

$$3 \times 2 = 6$$

$$1 \times 5 = 5$$

$$9 \times 1 = 9$$

$$1 \times 8 = 8$$

$$3 \times 3 = 9$$

$$4 \times 1 = 4$$

$$7 \times 1 = 7$$

$$3 \times 3 = 9$$

$$5 \times 1 = 5$$

$$1 \times 1 = 1$$

$$2 \times 2 = 4$$

ONE-DIGIT MULTIPLIER TIMES TWO-DIGIT MULTIPLICAND

Next we will consider problems having a one-digit multiplier and a two-digit multiplicand. In multiplying this type of problem we first determine the position of the multiplier and multiplicand. The multiplier, as always, is set as far left on the abacus as possible. Again we count the number of digits in the multiplier, add to it the number of digits in the multiplicand, plus one. The total, in this case, is 4. On the fourth column from the right edge of the abacus, set the first digit of the multiplicand, and set the rest of the digits in order to the right.

Study carefully the following examples.

$$4 \times 37 =$$

1. Multiply the first digit of the multiplier (in this case, the only digit) times the last digit of the multiplicand, i.e.

$$4 \times 7.$$

2. Set the product (28) in the first position to the right of

the multiplicand.

3. Clear the last digit of the multiplicand.
4. Multiply the first digit of the multiplier (4) times the remaining digit of the multiplicand (3).
5. Set the product (12) in the first position to the right of the remaining multiplicand. (Remember that the first position is always the first two columns to the right of whatever part of the multiplicand remains. In this case, the 1 is set in the column immediately to the right of the 3 of the multiplicand. The 2 of the product is set on the next column to the right which also is where the 2 of the first product (28) is set.)
6. Clear the remaining multiplicand.
7. The product, 148, is now shown on the abacus.

Now try another problem of the same kind.

$$6 \times 42 =$$

1. Multiply the first digit of the multiplier (6) times the last digits of the multiplicand (2).
2. Set the product (12) in the first position to the right of the multiplicand.
3. Clear the last digit of the multiplicand (2).
4. Multiply the first digit of the multiplier (6) times the remaining digit of the multiplicand (4).

5. Set the product (24) in the first position to the right of remaining multiplicand.

6. Clear the remaining multiplicand.

7. The product, 252, is now shown on the abacus.

Using the above procedure, work the following problems on your abacus.

$$3 \times 9 = 288$$

$$4 \times 39 = 156$$

$$8 \times 59 = 472$$

$$8 \times 72 = 576$$

$$9 \times 26 = 234$$

$$6 \times 62 = 372$$

$$5 \times 86 = 430$$

$$7 \times 47 = 329$$

$$4 \times 87 = 348$$

$$7 \times 58 = 406$$

$$2 \times 98 = 196$$

$$2 \times 69 = 138$$

$$4 \times 54 = 216$$

$$8 \times 46 = 368$$

$$6 \times 58 = 348$$

$$9 \times 85 = 765$$

$$5 \times 39 = 195$$

$$9 \times 43 = 387$$

$$3 \times 68 = 204$$

$$7 \times 84 = 588$$

$$8 \times 67 = 536$$

$$7 \times 92 = 644$$

$$4 \times 68 = 272$$

$$6 \times 78 = 468$$

$$2 \times 47 =$$

To work this problem follow this procedure carefully.

1. Multiply the first digit of the multiplier (2) times the last digit of the multiplicand (7).
2. Set the product (14) in the first position to the right of the multiplicand.
3. Clear the last digit of the multiplicand (7).
4. Multiply the first digit of the multiplier (2) times the remaining digit of the multiplicand (4).
5. Set the product (8) in the second column of the first

position to the right of the remaining multiplicand. (Notice this is a one-digit product.)

6. Clear the remaining multiplicand.

7. The product, 94, is now shown on the abacus.

Using the above procedure, work the following problems.

$$4 \times 26 = 104 \quad 8 \times 19 = 152 \quad 7 \times 14 = 98 \quad 6 \times 16 = 96$$

$$2 \times 39 = 78 \quad 3 \times 37 = 111 \quad 4 \times 23 = 92 \quad 3 \times 27 = 81$$

$$4 \times 62 =$$

Use the following procedure to work this problem 4×62 :

1. Multiply the first digit of the multiplier (4) times the last digit of the multiplicand (2).
2. Set the product (8) in the second column of the first position to the right of the multiplicand. (one-digit product)
3. Clear the last digit of the multiplicand (2).
4. Multiply the first digit of the multiplier (4) times the remaining digit of the multiplicand (6).
5. Set the product (24) in the first position to the right of the remaining multiplicand.
6. Clear the remaining multiplicand.
7. The product, 248, is now shown on the abacus.

Using the above procedure, work the following problems.

$$3 \times 93 = 279 \quad 6 \times 81 = 486 \quad 4 \times 92 = 368 \quad 3 \times 72 = 216$$

$$4 \times 41 = 124 \quad 2 \times 63 = 126 \quad 7 \times 61 = 427 \quad 2 \times 84 = 168$$

$$3 \times 21 =$$

Use the following procedure to work this problem.

1. Multiply the first digit of the multiplier (3) times the last digit of the multiplicand (1).
2. Set the product (3) in the second column of the first position to the right of the multiplicand.
3. Clear the last digit of the multiplicand (1).
4. Multiply the first digit of the multiplier (3) times the remaining digit of the multiplicand (2).
5. Set the product in the second column of the first position to the right of the multiplicand.
6. Clear the remaining multiplicand.
7. The product, 63, is now shown on the abacus.

Use the above procedure to work the following problems.

$$4 \times 21 = 84$$

$$3 \times 32 = 96$$

$$7 \times 11 = 77$$

$$2 \times 42 = 84$$

$$6 \times 11 = 66$$

$$2 \times 14 = 28$$

$$3 \times 23 = 69$$

$$4 \times 22 = 88$$

In the last three sets of practice exercises, you have been drilled in setting a one-digit product in the second column of the position in use. This is a very important concept. As we progress to different types of multiplication, this point will not be discussed again in detail. Still, it is absolutely necessary that you remember the concept and use it whenever a one-digit product occurs in any type of multiplication problem.

ONE-DIGIT MULTIPLIER TIMES THREE-DIGIT MULTIPLICANDS

Next, we will consider problems with one-digit multiplier, and three-digit multiplicands. The procedure is basically the same as that which we have already learned. Remember how to set the multiplicand. Follow this example carefully. Then work the following problems.

$$7 \times 648$$

1. Multiply the first digit of the multiplier (7) times the last digit of the multiplicand (8).
2. Set the product (56) in the first position to the right of the multiplicand.
3. Clear the last digit of the multiplicand (8).
4. Multiply the first digit of the multiplier (7) times the last digit in the remaining multiplicand. (4)
5. Set the product (28) in the first position to the right of the remaining multiplicand.
6. Clear the last digit of the remaining multiplicand (4).
7. Multiply the first digit of the multiplier (7) times the last digit of the remaining multiplicand (6).
8. Set the product (42) in the first position to the right of the remaining multiplicand.
9. The final product, 4536, is now shown on the abacus.

$$9 \times 382 = 3428$$

$$6 \times 523 = 3138$$

$$7 \times 836 = 5852$$

$$5 \times 637 = 3185$$

$$2 \times 968 = 1936$$

$$5 \times 274 = 1370$$

$$4 \times 857 = 3428$$

$$8 \times 742 = 5936$$

$$6 \times 792 = 4752$$

$$7 \times 429 = 3003$$

$$9 \times 475 = 4275$$

$$8 \times 429 = 3432$$

| | | |
|-----------------------|-----------------------|-----------------------|
| $6 \times 381 = 2286$ | $8 \times 417 = 3336$ | $3 \times 287 = 861$ |
| $4 \times \quad =$ | $2 \times 736 = 1472$ | $9 \times 134 = 1206$ |
| $3 \times 943 = 2829$ | $4 \times 629 = 2516$ | $2 \times 395 = 790$ |
| $2 \times 784 = 1568$ | $7 \times 314 = 2198$ | $4 \times 246 = 984$ |
| $5 \times 420 = 2100$ | $9 \times 141 = 1269$ | $6 \times 400 = 2400$ |
| $8 \times 960 = 7680$ | $3 \times 235 = 705$ | $4 \times 310 = 1240$ |
| $3 \times 420 = 1260$ | $2 \times 413 = 826$ | $2 \times 102 = 204$ |
| $2 \times 120 = 240$ | $4 \times 231 = 924$ | $3 \times 302 = 906$ |
| $8 \times 600 = 4800$ | $3 \times 603 = 1809$ | |
| $7 \times 408 = 2856$ | $4 \times 207 = 828$ | |
| $3 \times 905 = 2715$ | $2 \times 303 = 606$ | |
| $5 \times 804 = 4020$ | $3 \times 103 = 309$ | |

ONE-DIGIT MULTIPLIER TIMES LARGER MULTIPLICANDS

The same procedure that you have been using in the last set of practice exercises is used whenever a one-digit multiplier is taken times a multiplicand with any number of digits. Work these problems which have four-five-six-seven-digit multiplicands.

| | | |
|-------------------------|-------------------------|-------------------------|
| $8 \times 6943 = 55544$ | $6 \times 9475 = 56850$ | $7 \times 4197 = 29379$ |
| $7 \times 4876 = 34132$ | $5 \times 8732 = 43660$ | $6 \times 1719 = 10314$ |
| $4 \times 3587 = 14348$ | $3 \times 9586 = 28758$ | $3 \times 3421 = 10263$ |
| $9 \times 5736 = 51624$ | $8 \times 6743 = 53944$ | $2 \times 4372 = 8744$ |
| $4 \times 2132 = 8528$ | $6 \times 3870 = 23220$ | $4 \times 3200 = 12800$ |
| $3 \times 3213 = 9639$ | $4 \times 6940 = 27760$ | $3 \times 6030 = 18090$ |

| | | |
|-----------------------------------|-------------------------------|---------------------------|
| $2 \times 4213 = 8426$ | $2 \times 3720 = 7440$ | $2 \times 7004 = 14008$ |
| $3 \times 4321 = 12063$ | $5 \times 2100 = 10100$ | $3 \times 2003 = 6009$ |
| $6 \times 3043 = 18258$ | $6 \times 87564 = 525384$ | $2 \times 38241 = 76482$ |
| $7 \times 6008 = 42056$ | $9 \times 69735 = 627615$ | $6 \times 30780 = 184680$ |
| $5 \times 4702 = 23510$ | $5 \times 61743 = 308715$ | $9 \times 40009 = 360081$ |
| $3 \times 2301 = 6903$ | $4 \times 28132 = 112528$ | $3 \times 30201 = 90603$ |
| | | |
| $9 \times 465732 = 4191588$ | $8 \times 710003 = 5680024$ | |
| $4 \times 826541 = 3306164$ | $7 \times 2735687 = 19149809$ | |
| $2 \times 473214 = 946428$ | $4 \times 3241738 = 12966952$ | |
| $6 \times 601073 = 3606438$ | $6 \times 8070120 = 48420720$ | |
| $2 \times 2003104 = 4006208$ | $3 \times 4402601 = 13267803$ | |
| | | |
| $9 \times 246913578 = 2222222202$ | | |

TWO-DIGIT MULTIPLIER TIMES ONE-DIGIT MULTIPLICAND

Now we are ready to multiply numbers having a two-digit multiplier.

To multiply a two-digit multiplier times a one-digit multiplicand, follow this procedure carefully.

Remember:

Set the multiplicand in the correct location.

Use the proper finger and thumb motions.

Use the position concept correctly.

Study this example.

$$35 \times 7$$

1. Set 3 on the column farthest left, set 5 on the column next

to it on the right. Set 7 on the 4th column from the right.

2. Multiply the first digit of the multiplier (3) times the last digit of the multiplicand (7).
3. Set the product (21) in the first position (first two columns to right of multiplicand). (7).
4. Multiply the 2nd number of the multiplier (5) times the last digit of the multiplicand. (7).
5. Set the product (35) in the second position (columns 2 and 3 to the right of the multiplicand.)
6. Clear the multiplicand (since it has now been multiplied by every digit in the multiplier).
7. The final product, 245, is now shown on the abacus.

Work the following problems using the procedures described above.

$$52 \times 7 = 364$$

$$82 \times 4 = 328$$

$$27 \times 4 = 108$$

$$73 \times 8 = 584$$

$$63 \times 2 = 126$$

$$35 \times 3 = 105$$

$$94 \times 3 = 282$$

$$21 \times 9 = 189$$

$$48 \times 2 = 96$$

$$27 \times 8 = 216$$

$$43 \times 3 = 129$$

$$24 \times 3 = 72$$

$$46 \times 6 = 276$$

$$71 \times 6 = 426$$

$$19 \times 8 = 152$$

$$35 \times 4 = 140$$

$$52 \times 3 = 156$$

$$37 \times 2 = 74$$

$$69 \times 2 = 138$$

$$31 \times 7 = 217$$

$$14 \times 6 = 84$$

$$74 \times 3 = 222$$

$$93 \times 3 = 279$$

$$46 \times 2 = 92$$

$$12 \times 3 = 36$$

$$90 \times 7 = 630$$

$$32 \times 2 = 64$$

$$60 \times 8 = 480$$

$$21 \times 4 = 84$$

$$30 \times 2 = 60$$

$$33 \times 3 = 99$$

$$20 \times 4 = 80$$

LARGER MULTIPLIERS TIMES ONE-DIGIT MULTIPLICANDS

Multiplication of three-four-five-digit (etc.) multipliers times one-digit multiplicands follows the same basic pattern as is used above. We simply multiply the multiplicand by every digit in the multiplier, starting with the far left digit and proceeding consecutively to the right. Try these problems.

$$642 \times 8 = 5136$$

$$482 \times 3 = 1446$$

$$285 \times 4 = 1140$$

$$232 \times 6 = 1392$$

$$973 \times 2 = 1946$$

$$378 \times 3 = 1134$$

$$324 \times 7 = 2268$$

$$591 \times 8 = 4728$$

$$164 \times 7 = 1148$$

$$667 \times 2 = 1334$$

$$642 \times 4 = 2568$$

$$143 \times 3 = 429$$

$$365 \times 4 = 1460$$

$$327 \times 4 = 1308$$

$$214 \times 2 = 428$$

$$839 \times 7 = 5873$$

$$836 \times 3 = 2508$$

$$270 \times 8 = 2160$$

$$946 \times 8 = 7568$$

$$417 \times 9 = 3753$$

$$460 \times 5 = 2300$$

$$473 \times 6 = 2838$$

$$546 \times 2 = 1092$$

$$308 \times 2 = 616$$

$$902 \times 6 = 5412$$

$$603 \times 3 = 1809$$

$$7835 \times 6 = \begin{array}{l} 47010 \\ 44610 \end{array}$$

$$6543 \times 8 = 52344$$

$$4782 \times 9 = 43038$$

$$5378 \times 7 = 37646$$

$$6943 \times 3 = 20829$$

$$4827 \times 4 = 19308$$

$$5379 \times 2 = 10758$$

$$1732 \times 8 = 13856$$

$$1940 \times 7 = 13580$$

$$8700 \times 5 = 43500$$

$$9000 \times 6 = 54000$$

$$8305 \times 3 = 24915$$

$$4072 \times 4 = 16288$$

$$67894 \times 8 = 543152$$

$$53762 \times 6 = 322572$$

$$42863 \times 3 = 128589$$

$$27041 \times 4 = 108164$$

$$54705 \times 7 = 452935$$

$$30006 \times 2 = 60012$$

$$40000 \times 8 = 320000$$

$$19020 \times 6 = 114120$$

TWO-DIGIT MULTIPLIER TIMES TWO-DIGIT MULTIPLICAND

Now we are ready to study multiplication involving two-digit multipliers and two-digit multiplicands.

We must be certain to continue setting the multiplicand correctly.

Use proper finger motions.

Use position concept correctly.

When doing this type of multiplication, follow this procedure.

$$43 \times 76$$

1. Multiply the first digit of the multiplier (4) times the last digit of the multiplicand (6).
2. Set the product (24) in the first position (columns 1 and 2) to the right of the multiplicand.
3. Multiply the second digit of the multiplier (3) times the last digit of the multiplicand (6).
4. Set the product (18) in the second position (columns 2 and 3) to the right of the multiplicand.
5. Clear the last digit of the multiplicand (6) since it has now been multiplied by every number in the multiplier.
6. Now multiply the first digit of the multiplier (4) times the now last digit of the multiplicand. (7).
7. Set the product (28) in the now first position to the right of the remaining multiplicand. (If your calculation thus far are correct, you will set the 2 of 28 in the empty column immediately to the right of the 7. You will add the eight to the next column by clearing 2 and setting one left.

To the right of the seven you should now have 3058.

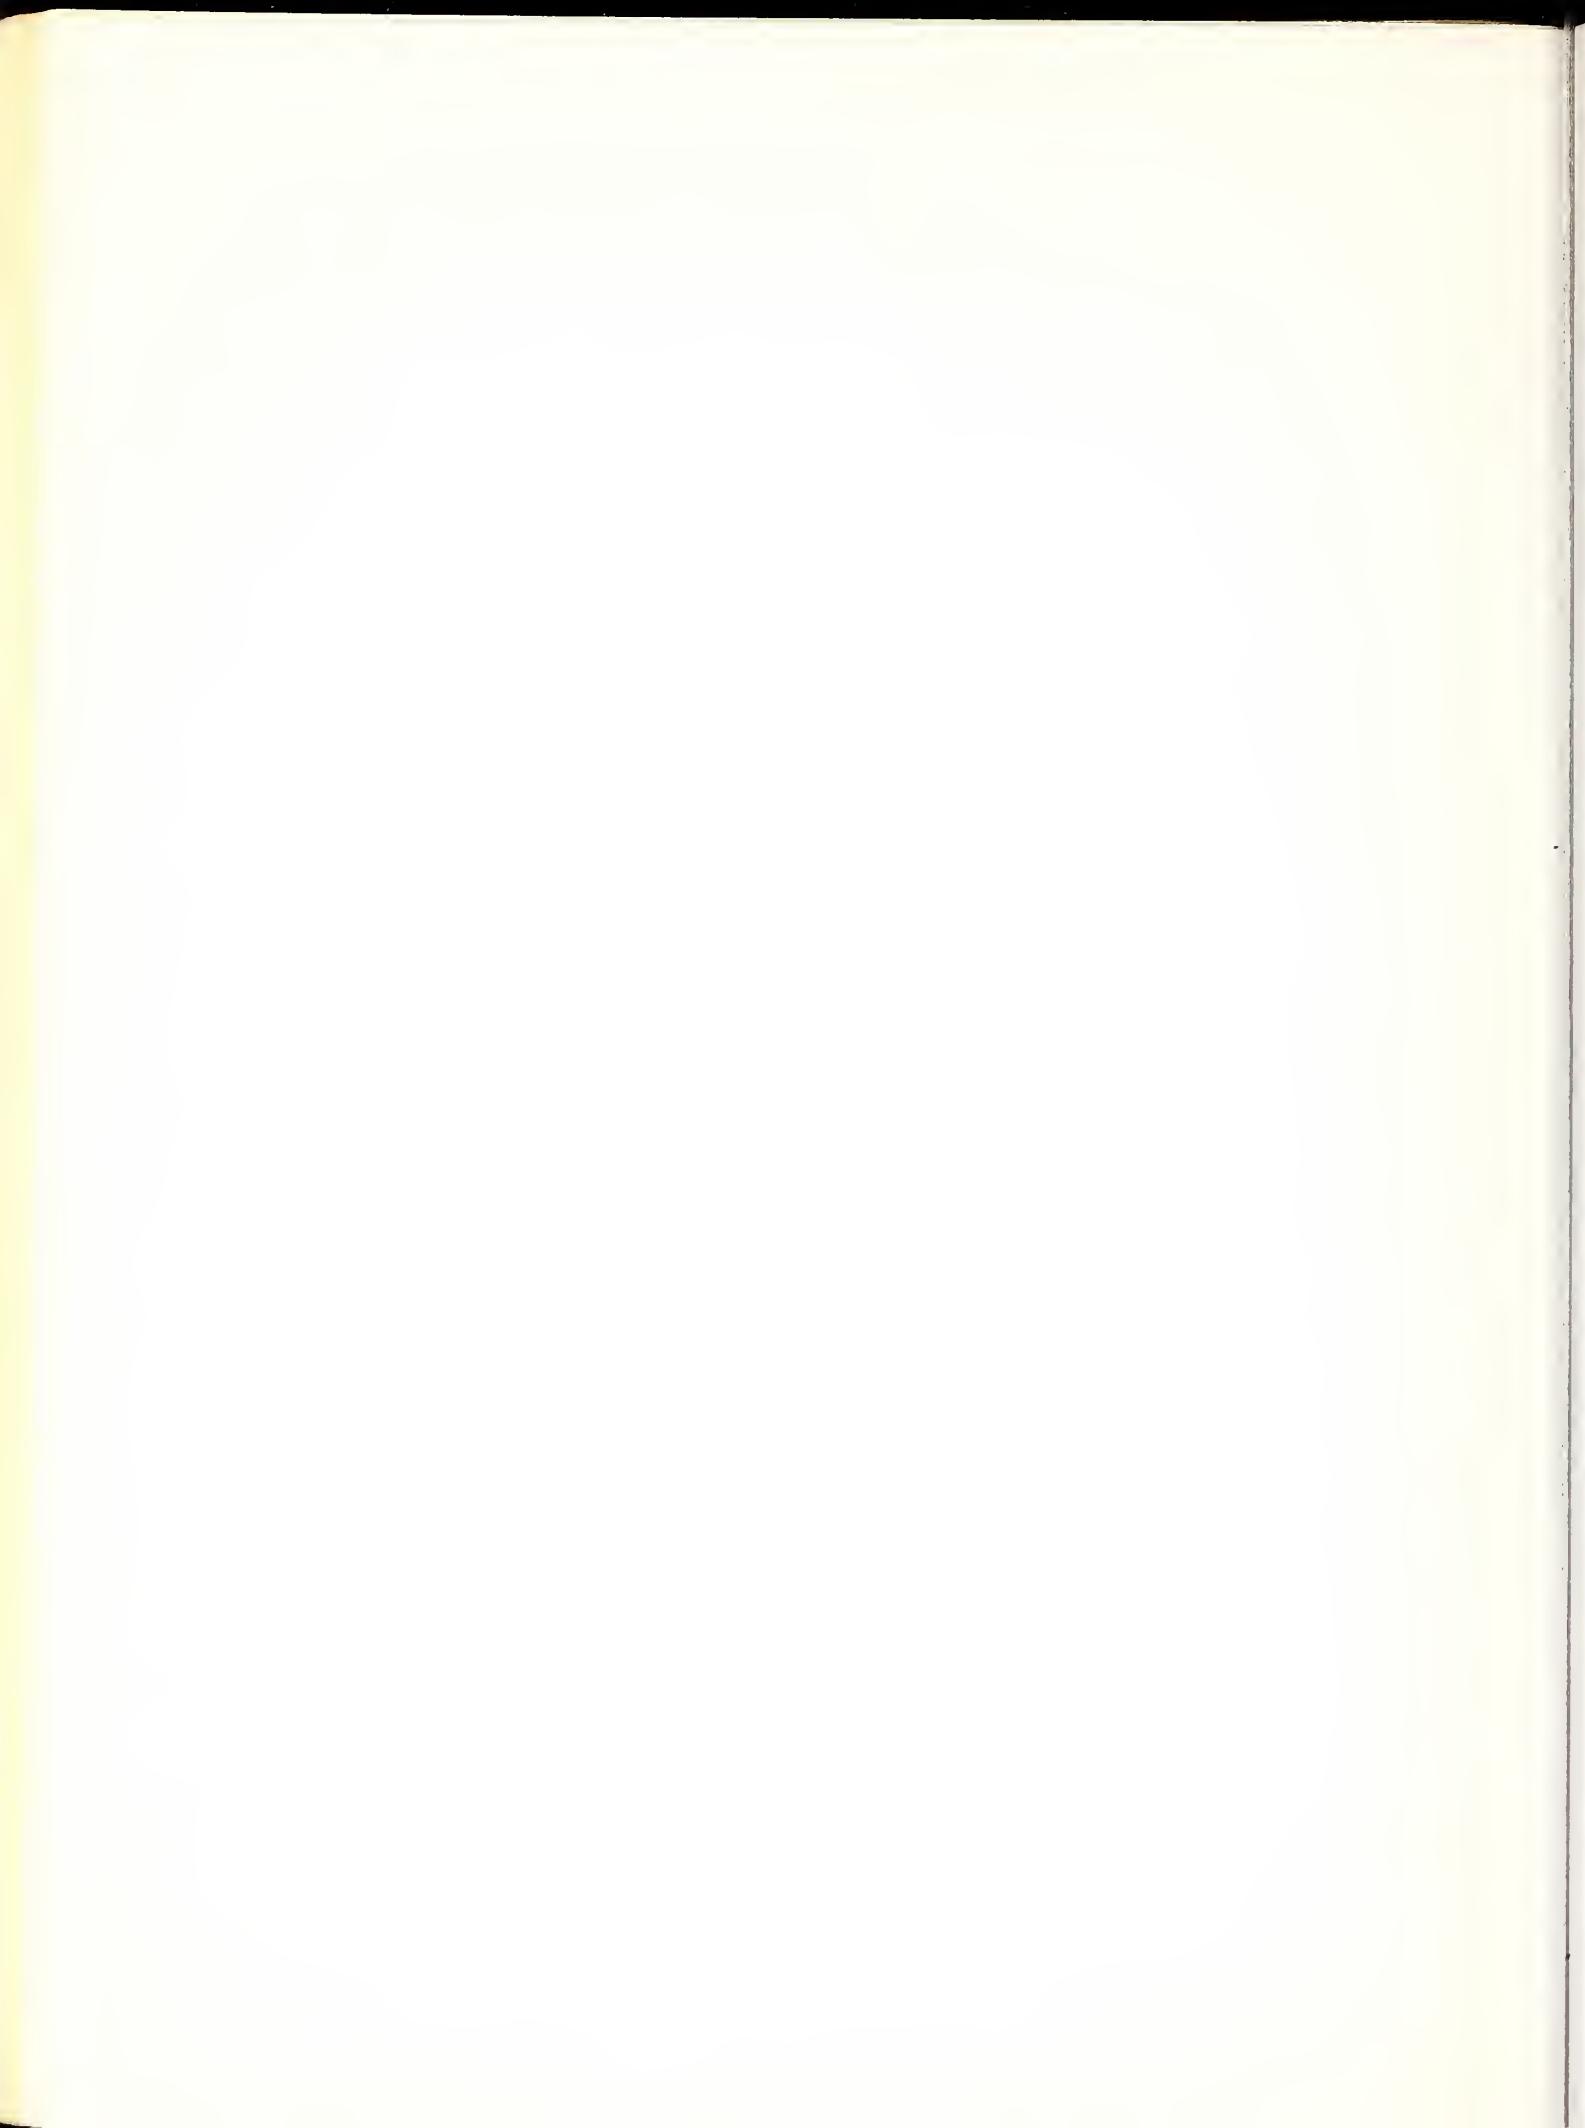

8. Next multiply the second digit of the multiplier (3) times the now last digit of the multiplicand. (7).
9. Set the product (21) in the second position to the right of the remaining multiplicand.
10. Clear the multiplicand (7) since it has been multiplied by all digits of the multiplier.
11. The final product, 3268, is now shown on the abacus.

Now try the next problem, using the same procedure. The instructions here are much more concise. If you find you need more detailed help, turn again to the problem just completed.

$$83 \times 94$$

1. First (8) times last (4).
Product (32) first position.
2. Second (3) times last (4).
Product (12) second position.
3. Clear last of multiplicand (4).
4. First (8) times now last (9).
Product (72) now first position.
5. Second (3) times now last (9).
Product (27) now second position.
6. Clear now last of multiplicand (9).
7. Answer - 7802

To gain speed and accuracy in the multiplication of two-digit

multipliers times two-digit multiplicands, work the following problems.

$$79 \times 25 = 1975$$

$$37 \times 58 = 2146$$

$$47 \times 39 = 1833$$

$$82 \times 96 = 7872$$

$$58 \times 37 = 2146$$

$$67 \times 24 = 1608$$

$$26 \times 79 = 2054$$

$$45 \times 73 = 3285$$

$$26 \times 93 = 2418$$

$$67 \times 81 = 2427$$

$$48 \times 72 = 3456$$

$$35 \times 53 = 1855$$

$$71 \times 89 = 6319$$

$$62 \times 74 = 4588$$

$$53 \times 92 = 4876$$

$$91 \times 67 = 6097$$

$$37 \times 28 = 1036$$

$$46 \times 24 = 1104$$

$$19 \times 86 = 1634$$

$$14 \times 57 = 798$$

$$23 \times 31 = 713$$

$$34 \times 21 = 714$$

$$90 \times 71 = 6390$$

$$84 \times 50 = 4200$$

$$30 \times 21 = 630$$

$$67 \times 80 = 5360$$

$$40 \times 35 = 1400$$

$$70 \times 86 = 6020$$

$$42 \times 60 = 2520$$

$$31 \times 20 = 620$$

LARGER MULTIPLIERS TIMES LARGER MULTIPLICANDS

Regardless of how many digits in either the multiplier or multiplicand, the multiplication procedure is basically the same. You always begin with the first digit of the multiplier times the last digit of the multiplicand. You continue by multiplying that last digit of the multiplicand times each consecutive digit of the multipliers through the last one. Then clear that last digit, and repeat the process starting again with the first digit of the multiplier. Continue until all digits of the multiplicand have been cleared. Also, you must remember that the product of the first multiplication of each multiplicand goes into the present first position, the second product into

the second position, and so on.

Next, let's consider briefly the multiplication procedure for three-digit multipliers and two-digit multiplicands.

$$374 \times 59$$

1. First (3) times last (9) - product (27) first position.
2. Second (7) times last (9) - product (63) second position.
3. Third (4) times last (9) - product (36) third position.
4. Clear Last of multiplicand (9).
5. First (3) times now last (5) - product (15) now first position.
6. Second (7) times now last (5) - product (35) now second position.
7. Third (4) times now last (5) - product (20) now third position.
8. Clear now last of multiplicand.
9. Answer - 22066

Do these problems for practice. Some of them have three-digit multipliers, some have four-digit, some five. The procedure for all of them is nearly the same.

$$476 \times 38 = 18088$$

$$864 \times 72 = 62208$$

$$400 \times 40 = 16000$$

$$593 \times 84 = 49812$$

$$971 \times 86 = 83506$$

$$270 \times 10 = 2700$$

$$725 \times 95 = 68875$$

$$473 \times 61 = 28853$$

$$493 \times 20 = 9860$$

$$368 \times 27 = 9956$$

$$640 \times 87 = 55680$$

$$924 \times 36 = 33264$$

$$702 \times 63 = 44226$$

$$3674 \times 98 = 360052$$

$$6429 \times 73 = 469317$$

$$4060 \times 87 = 353220$$

$$7486 \times 39 = 291954$$

$$7581 \times 64 = 485184$$

$$6024 \times 13 = 78312$$

$$5738 \times 64 = 367232$$

$$8963 \times 21 = 188223$$

$$3000 \times 30 = 90000$$

$$2657 \times 38 = 100966$$

$$4870 \times 36 = 175320$$

$$7000 \times 60 = 420000$$

$$4389 \times 26 = 114114$$

$$7306 \times 55 = 387218$$

$$67849 \times 35 = 2374715$$

$$72031 \times 34 = 2449054$$

If we increase the number of digits in the multiplicand, the basic multiplication procedure remains the same. We begin by multiplying the first digit of the multiplier times the last digit of the multiplicand. Then we continue to multiply that last digit of the multiplicand by every consecutive digit of the multiplier. Then we clear that last digit and repeat the whole process for each new last digit of the multiplicand.

Do these problems for practice.

$$47 \times 396 = 18612$$

$$83 \times 396 = 32868$$

$$23 \times 401 = 9223$$

$$63 \times 784 = 49392$$

$$75 \times 184 = 13800$$

$$84 \times 600 = 50400$$

$$86 \times 437 = 37582$$

$$32 \times 235 = 7520$$

$$34 \times 402 = 13668$$

$$29 \times 863 = 25027$$

$$19 \times 308 = 5852$$

$$70 \times 500 = 35000$$

$$35 \times 927 = 32445$$

$$20 \times 974 = 19480$$

$$49 \times 6783 = 332367$$

$$37 \times 2639 = 97643$$

$$263 \times 4789 = 1259507$$

$$73 \times 4698 = 342954$$

$$91 \times 7268 = 661388$$

$$5496 \times 746 = 4098216$$

$$58 \times 7436 = 431288$$

$$32 \times 4321 = 138272$$

$$4691 \times 875 = 4068315$$

$$842 \times 679 = 571718$$

$$67 \times 8404 = 563068$$

$$321 \times 1234 = 396114$$

$$456 \times 793 = 361608$$

$$381 \times 243 = 92583$$

$$6070 \times 348 = 2112360$$

$$374 \times 985 = 368390$$

$$436 \times 327 = 142572$$

$$809 \times 4902 = 3965718$$

$$653 \times 478 = 312134$$

$$760 \times 894 = 679440$$

$$600 \times 8000 = 4800000$$

ADDITIONAL PRACTICE

For additional practice in multiplication work these problems with interesting products. You will be able to set only the multiplicand on the abacus since there is not room enough for both it and the multiplier. The multipliers here are short, however, and you should be able to remember them easily.

$$18 \times 123,456,789 = 2,222,222,202$$

$$9 \times 9 = 81$$

$$27 \times 123,456,789 = 3,333,333,303$$

$$81 \times 9 = 729$$

$$36 \times 123,456,788 = 4,444,444,404$$

$$729 \times 9 = 6561$$

$$45 \times 123,456,789 = 5,555,555,505$$

$$6561 \times 9 = 59049$$

$$54 \times 123,456,789 = 6,666,666,606$$

$$59049 \times 9 = 531441$$

$$63 \times 123,456,788 = 7,777,777,707$$

$$531441 \times 9 = 4782969$$

$$72 \times 123,456,789 = 8,888,888,808$$

$$81 \times 123,456,789 = 9,999,999,909$$

$$8 \times 8 = 64$$

$$7 \times 9 = 49$$

$$6 \times 6 = 36$$

$$64 \times 8 = 512$$

$$49 \times 7 = 343$$

$$36 \times 6 = 216$$

$$512 \times 8 = 4096$$

$$343 \times 7 = 2401$$

$$216 \times 6 = 1296$$

$$4096 \times 8 = 32768$$

$$2401 \times 7 = 16807$$

$$1296 \times 6 = 7776$$

$$32768 \times 8 = 262144$$

$$16807 \times 7 = 117649$$

$$7776 \times 6 = 46656$$

$$262144 \times 8 = 2097152$$

$$117649 \times 7 = 823543$$

$$46656 \times 6 = 279936$$

$$5 \times 5 = 25$$

$$4 \times 4 = 16$$

$$3 \times 3 = 9$$

$$25 \times 5 = 125$$

$$16 \times 4 = 64$$

$$9 \times 3 = 27$$

$$125 \times 5 = 625$$

$$64 \times 4 = 256$$

$$27 \times 3 = 81$$

$$\begin{array}{lll}
 625 \times 5 = 3125 & 256 \times 4 = 1024 & 81 \times 3 = 243 \\
 3125 \times 5 = 15625 & 1024 \times 4 = 4096 & 243 \times 3 = 729 \\
 15625 \times 5 = 78125 & 4096 \times 4 = 16384 & 729 \times 3 = 2187
 \end{array}$$

$$2 \times 2 = 4$$

$$4 \times 2 = 8$$

$$8 \times 2 = 16$$

$$16 \times 2 = 32$$

$$32 \times 2 = 64$$

$$64 \times 2 = 128$$

MULTIPLICATION OF DECIMALS

When multiplying decimals, simply proceed as if the decimal points were not present. Once you obtain the final product count the number of decimal places in the multiplier and multiplicand combined; then count off that many decimal places in the product.

Thus,

$435 \times 79 = 34365$ is worked the same as $43.5 \times 79 = 3436.5$

or $43.5 \times 7.9 = 343.65$ or $4.35 \times .79 = 3.4365$; but the number of decimal places in the products differ.

When either the multiplier or multiplicand is less than one and has one or more zeroes as place holders between the decimal and the first value digit (.04, .007, .075, .0006, .000675), then, in counting digits to determine the placement of the multiplicand, count only the number of value digits, and then add one as usual. Thus, $.07 \times .08$ would have the multiplicand set on the third column from the right

(1 value digit in multiplier + 1 value digit in multiplicand +1 = 3).

Do the following problems for practice in the multiplication of decimals.

$$4.2 \times 6.87 = 28.854$$

$$.65 \times 4.02 = 2.6130$$

$$.34 \times \$6.75 = \$2.2950$$

$$36 \times 8.07 = 290.52$$

$$7.4 \times .348 = 2.5752$$

$$5.9 \times .007 = .0413$$

$$\$8.95 \times \$6.07 = \$54.3265$$

$$8.15 \times .057 = .46455$$

$$.78 \times .3 = .234$$

$$7.01 \times .08 = .1608$$

$$7.06 \times 3.001 = 21.18706$$

$$.006 \times 3.7 = .0222$$

$$\$1.23 \times \$3.21 = \$3.0483$$

$$.09 \times 6.75 = .6075$$

$$5.9 \times 6.783 = 40.0197$$

$$.007 \times .016 = .000112$$

$$66.2 \times 38.4 = 2542.08$$

$$.003 \times .0068 = .0000204$$

SUBTRACTION

DIRECT SUBTRACTION

Subtraction, like addition, is done either directly or with the use of secrets. In subtraction, the number from which another number is subtracted is the minuend. The number that is subtracted from that minuend is the subtrahend. The difference or answer is the remainder.

As in addition, subtraction on the abacus is done from left to right. Finger usage remains the same except for one change which will be demonstrated in example #2 below.

Example #1 of Direct Subtraction.

$$873 - 321 = 552$$

1. Set 873 on the last three columns on the right side of the abacus.
2. On the hundreds column, with the right forefinger, clear 3 earth counters.
3. On the tens column, with the right forefinger, clear 2 earth counters.
4. On the units column, with the right forefinger, clear 1 earth counter.
5. The answer, 552, is now shown on the abacus.

Example #2

$$798 - 678 = 120$$

1. Set 798 on the last three columns at the right of the abacus.
2. On the hundreds column, with one movement, clear the heaven counter with the right forefinger and clear one earth counter with the right thumb. (Notice this one change in finger usage.)
3. On the tens column, with one movement, clear the heaven counter with the right forefinger and clear two earth counters with the thumb.

4. On the units column, with one movement, clear the heaven counter with the right forefinger and clear three earth counters with the thumb.

5. The answer 120 is shown on the abacus.

Work the following problems as practice in simple subtraction.

Always use the proper fingers, and always work from left to right.

$$\begin{array}{r}
 94 & 78 & 63 & 87 & 96 & 68 & 794 & 597 & 389 & 7964 & 8642 & 9726 \\

 1005 & 1005 & 1501
 \end{array}$$

SECRETS

Now we will consider subtraction using secrets as we did with addition. Once again, it is important that you memorize the secrets until they become automatic. The seventeen secrets used in subtraction are listed below. Study them carefully.

| <u>To Subtract</u> | <u>Secret</u> |
|--------------------|---------------------|
| 1 | Clear 1 left, Set 9 |
| 1 | Set 4, Clear 5 |
| 2 | Clear 1 left, Set 8 |
| 2 | Set 3, Clear 5 |
| 3 | Clear 1 left, set 7 |
| 3 | Set 2, Clear 5 |
| 4 | Clear 1 left, Set 6 |

| <u>To Subtract</u> | <u>Secret</u> |
|--------------------|------------------------------|
| 4 | Set 1, Clear 5 |
| 5 | Clear 1 left, Set 5 |
| 6 | Clear 1 left, Set 4 |
| 6 | Clear 1 left, Set 5, Clear 1 |
| 7 | Clear 1 left, Set 3 |
| 7 | Clear 1 left, Set 5, Clear 2 |
| 8 | Clear 1 left, Set 2 |
| 8 | Clear 1 left, Set 5, Clear 3 |
| 9 | Clear 1 left, Set 1 |
| 9 | Clear 1 left, Set 5, Clear 4 |

SECRETS FOR SUBTRACTING ONE

First we will study the secrets for subtracting 1.

Clear 1 left, Set 9

Set 4, Clear 5

For practice, set the number 999 and repeatedly subtract 1 until you reach 0. Proceed in this manner.

1. Set 999 on the last three columns at the right of the abacus.
2. On the units column, clear one earth counter with the right forefinger.
3. On the units column, clear one earth counter with the right forefinger.
4. On the units column, clear one earth counter with the right forefinger.
5. On the units column, clear one earth counter with the right

forefinger.

6. On the units column, set four earth counters with the thumb and clear one heaven counter with the forefinger. (Set 4, Clear 5).
7. On the units column, clear one earth counter with the forefinger.
8. On the units column, clear one earth counter with the forefinger.
9. On the units column, clear one earth counter with the forefinger.
10. On the units column, clear one earth counter with the forefinger.
11. On the tens column, clear one earth counter with the right forefinger. Then with one movement, on the units column set the heaven counter with the forefinger and set 4 earth counters with the thumb. (Clear 1 left, Set 9).

Continue on in this manner until you master the secrets for subtracting one. Then do these problems.

$$\begin{array}{r}
 34 \quad 78 \quad 55 \quad 20 \quad 50 \quad 95 \quad 80 \quad 759 \quad 705 \quad 850 \\
 -11 \quad -111 \quad -111 \quad -111 \\
 \hline
 23 \quad 67 \quad 44 \quad 9 \quad 39 \quad 84 \quad 69 \quad 648 \quad 594 \quad 739
 \end{array}$$

Finally, set the number 9,987,654,321

Then subtract

$$\begin{array}{r}
 - 111,111,111 \\
 \hline
 9,876,543,210
 \end{array}$$

Again subtract

$$\begin{array}{r}
 - 111,111,111 \\
 \hline
 9,765,432,099
 \end{array}$$

Again subtract

$$\begin{array}{r}
 - 111,111,111 \\
 \hline
 9,654,320,988
 \end{array}$$

Again subtract

$$\begin{array}{r}
 - 111,111,111 \\
 \hline
 9,543,209,877
 \end{array}$$

| | |
|----------------|----------------------|
| Again subtract | 9.543,209,877 |
| | - <u>111,111,111</u> |
| | 9,432,098,766 |
| Again subtract | - <u>111,111,111</u> |
| | 9,320,987,655 |
| Again subtract | - <u>111,111,111</u> |
| | 9,209,876,544 |
| Again subtract | - <u>111,111,111</u> |
| | 9,098,765,433 |
| Again subtract | - <u>111,111,111</u> |
| | 8,987,654,322 |

SECRETS FOR SUBTRACTING TWO

Now we will consider the secrets for subtracting 2.

Clear 1 left, Set 8

Set 3, Clear 5

1. Set 999
2. Clear 2
3. Clear 2
4. Set 3, Clear 5
5. Clear 2
6. Clear 1 left, Set 8
7. Clear 2
8. Clear 2
9. Set 3, Clear 5
10. Clear 2
11. Clear 1 left, Set 8

Etc.

For practice, do these problems.

$$\begin{array}{r}
 34 \quad 97 \quad 65 \quad 56 \quad 75 \quad 96 \quad 686 \quad 567 \quad 945 \quad 865 \quad 91 \quad 71 \quad 40 \\
 -22 \quad -22 \quad -22 \quad -22 \quad -22 \quad -22 \quad -222 \quad -222 \quad -222 \quad -222 \quad -22 \quad -22 \quad -22 \\
 \hline
 12 \quad 75 \quad 43 \quad 34 \quad 53 \quad 74 \quad 464 \quad 345 \quad 723 \quad 643 \quad 69 \quad 49 \quad 18
 \end{array}$$

$$\begin{array}{r}
 31 \quad 910 \quad 701 \quad 815 \quad 6081 \quad 5316 \quad 54610 \quad 68501 \quad 40651 \quad 71605 \\
 -22 \quad -222 \quad -222 \quad -222 \quad -2222 \quad -2222 \quad -22222 \quad -22222 \quad -22222 \quad -22222 \\
 \hline
 9 \quad 688 \quad 479 \quad 593 \quad 3859 \quad 3094 \quad 32388 \quad 46279 \quad 18429 \quad 49383
 \end{array}$$

$$\begin{array}{r}
 91670 \\
 -22222 \\
 \hline
 69448
 \end{array}$$

Finally, set the number 9,987,654,321. From it subtract

222,222,222 nine consecutive times and obtain these results:

9,765,432,099
 9,543,209,877
 9,320,987,655
 9,098,765,433
 8,876,543,211
 8,654,320,989
 8,432,098,767
 8,209,876,545
 7,987,654,323

SECRETS FOR SUBTRACTING THREE

Next we will practice the secrets for subtracting 3.

Clear 1 left, Set 7

Set 2, Clear 5

1. Set 999
2. Clear 3
3. Set 2, Clear 5
4. Clear 3
5. Clear 1 left, Set 7
6. Set 2, Clear 5

8. Clear 3
9. Clear 1 left, Set 7
10. Clear 3
11. Set 2, Clear 5
12. Clear 1 left, Set 7

Etc.

For more practice in subtracting 3, do these problems.

$$\begin{array}{r}
 34 \quad 98 \quad 86 \quad 59 \quad 65 \quad 76 \quad 57 \quad 576 \quad 475 \quad 635 \quad 547 \quad 42 \quad 90 \\
 -33 \quad -333 \quad -333 \quad -333 \quad -333 \quad -33 \quad -33 \\
 \hline
 1 \quad 65 \quad 53 \quad 26 \quad 32 \quad 43 \quad 24 \quad 243 \quad 142 \quad 302 \quad 214 \quad 9 \quad 57
 \end{array}$$

$$\begin{array}{r}
 81 \quad 91 \quad 71 \quad 62 \quad 92 \quad 712 \quad 361 \quad 5261 \quad 62517 \quad 85760 \quad 91526 \\
 -33 \quad -33 \quad -33 \quad -33 \quad -33 \quad -333 \quad -333 \quad -3333 \quad -33333 \quad -12321 \quad -32332 \\
 \hline
 48 \quad 58 \quad 38 \quad 29 \quad 59 \quad 379 \quad 28 \quad 1928 \quad 29184 \quad 73439 \quad 59194
 \end{array}$$

$$\begin{array}{r}
 74125 \quad 65107 \\
 -32232 \quad -21333 \\
 \hline
 41893 \quad 43774
 \end{array}$$

Finally, set the number 9,987,654,321. Then subtract 333,333,333 from the number nine consecutive times.

9,654,320,988
 9,320,987,655
 8,987,654,322
 8,654,320,989
 8,320,987,656
 7,987,654,323
 7,654,320,990
 7,320,987,657
 6,987,654,324

For added practice in subtracting 1, 2, and 3, set 9,999,999,999,999. Then subtract 123,123,123,123 nine consecutive times obtaining these remainders.

9,876,876,876,876
 9,753,753,753,753
 9,630,630,630,630
 9,507,507,507,507
 9,384,384,384,384
 9,261,261,261,261
 9,138,138,138,138
 9,015,015,015,015
 8,891,891,891,892

SECRETS FOR SUBTRACTING FOUR

Now study the secrets for subtracting 4.

Clear 1 left, Set 6

Set 1, Clear 5

1. Set 999
2. Clear 4
3. Set 1, Clear 5
4. Clear 1 left, Set 6
5. Set 1, Clear 5
6. Clear 1 left, Set 6
7. Clear 4
8. Set 1, Clear 5
9. Clear 1 left, Set 6

Etc.

Practice these problems.

$$\begin{array}{r}
 94 \quad 49 \quad 64 \quad 86 \quad 67 \quad 98 \quad 87 \quad 678 \quad 597 \quad 685 \quad 82 \quad 71 \quad 93 \\
 -44 \quad -444 \quad -444 \quad -444 \quad -44 \quad -44 \quad -44 \\
 \hline
 50 \quad 5 \quad 20 \quad 42 \quad 23 \quad 54 \quad 43 \quad 234 \quad 153 \quad 241 \quad 38 \quad 27 \quad 49
 \end{array}$$

$$\begin{array}{r}
 125 \quad 612 \quad 327 \quad 740 \quad 631 \quad 761 \quad 821 \quad 813 \quad 413 \quad 671 \quad 8631 \\
 -44 \quad -444 \quad -44 \quad -444 \quad -444 \quad -444 \quad -444 \quad -444 \quad -44 \quad -444 \quad -4444 \\
 \hline
 81 \quad 168 \quad 283 \quad 296 \quad 187 \quad 317 \quad 377 \quad 369 \quad 369 \quad 227 \quad 4187
 \end{array}$$

$$\begin{array}{r}
 7538 \quad 57138 \quad 72032 \\
 -4444 \quad -44444 \quad -44444 \\
 \hline
 3094 \quad 12694 \quad 27588
 \end{array}$$

Finally set the number 9,987,654,321. Then subtract 444,444,444 nine consecutive times obtaining these remainders.

9,543,209,877
 9,098,765,433
 8,654,320,989
 8,209,876,545
 7,765,432,101
 7,320,982,657
 6,876,543,213
 6,432,098,769
 5,987,654,325

SECRET FOR SUBTRACTING FIVE

Next consider the secret for subtracting 5.

Clear 1 left, Set 5

1. Set 999
2. Clear 5
3. Clear 1 left, Set 5
4. Clear 5
5. Clear 1 left, Set 5
6. Clear 5
7. Clear 1 left, Set 5

Etc.

Practice these problems.

$$\begin{array}{r}
 55 \quad 95 \quad 58 \quad 73 \quad 84 \quad 61 \quad 92 \quad 382 \quad 724 \quad 612 \quad 213 \quad 671 \quad 703 \\
 -55 \quad -555 \quad -555 \quad -55 \quad -555 \quad -555 \\
 \hline
 00 \quad 40 \quad 3 \quad 18 \quad 29 \quad 6 \quad 37 \quad 327 \quad 169 \quad 57 \quad 158 \quad 116 \quad 148
 \end{array}$$

$$\begin{array}{r}
 602 \quad 800 \quad 1207 \quad 7203 \quad 3010 \\
 -555 \quad -555 \quad -555 \quad -555 \quad -555 \\
 \hline
 47 \quad 245 \quad 652 \quad 6648 \quad 2455
 \end{array}$$

Finally, set the number 9,987,654,321 and subtract 555,555,555 nine consecutive times obtaining these remainders.

9,432,098,766
8,876,543,211
8,320,987,656
7,765,432,101
7,209,876,546
6,654,320,991
6,098,765,436
5,543,209,881
4,987,654,326
4,432,098,771

SECRETS FOR SUBTRACTING SIX

Next study the secrets for subtracting 6.

Clear 1 left, Set 4

Clear 1 left, Set 5, Clear 1

1. Set 999

2. Clear 6, on the units column, with one movement, clear the heaven counter with the right forefinger and clear one earth counter with the thumb.

3. Clear 1 left, Set 5, Clear 1. On the tens column, clear one earth counter with the right forefinger. Then on the units column, set one heaven counter with the forefinger and continue on to clear 1 earth counter on the same column, with the same finger.

4. Clear 6

5. Clear 1 left, Set 5, Clear 1

6. Clear 1 left, Set 4. On the tens column, clear 1 earth counter with the forefinger. At the same time on the

units column set 4 earth counters with the thumb.

7. Clear 6

8. Clear 1 left, Set 5, Clear 1

Etc.

Do these problems to practice subtracting 6.

$$\begin{array}{r} 98 \\ -66 \\ \hline 32 \end{array} \quad \begin{array}{r} 76 \\ -66 \\ \hline 10 \end{array} \quad \begin{array}{r} 70 \\ -66 \\ \hline 4 \end{array} \quad \begin{array}{r} 85 \\ -66 \\ \hline 19 \end{array} \quad \begin{array}{r} 95 \\ -66 \\ \hline 29 \end{array} \quad \begin{array}{r} 805 \\ -66 \\ \hline 739 \end{array} \quad \begin{array}{r} 350 \\ -66 \\ \hline 284 \end{array} \quad \begin{array}{r} 495 \\ -66 \\ \hline 429 \end{array} \quad \begin{array}{r} 73 \\ -66 \\ \hline 7 \end{array} \quad \begin{array}{r} 82 \\ -66 \\ \hline 16 \end{array} \quad \begin{array}{r} 91 \\ -66 \\ \hline 25 \end{array} \quad \begin{array}{r} 842 \\ -66 \\ \hline 776 \end{array} \quad \begin{array}{r} 732 \\ -66 \\ \hline 666 \end{array}$$

$$\begin{array}{r} 625 \\ -66 \\ \hline 559 \end{array} \quad \begin{array}{r} 803 \\ -666 \\ \hline 137 \end{array} \quad \begin{array}{r} 410 \\ -66 \\ \hline 344 \end{array} \quad \begin{array}{r} 307 \\ -66 \\ \hline 241 \end{array} \quad \begin{array}{r} 954 \\ -666 \\ \hline 288 \end{array} \quad \begin{array}{r} 125 \\ -66 \\ \hline 59 \end{array} \quad \begin{array}{r} 67152 \\ -66666 \\ \hline 486 \end{array} \quad \begin{array}{r} 48105 \\ -6666 \\ \hline 41439 \end{array} \quad \begin{array}{r} 84015 \\ -66666 \\ \hline 17349 \end{array} \quad \begin{array}{r} 70401 \\ -66666 \\ \hline 3735 \end{array}$$

$$\begin{array}{r} 95402 \\ -66666 \\ \hline 28736 \end{array}$$

Finally, set the number 9,987,654,321 and subtract from it the number 666,666,666 nine consecutive times obtaining these remainders.

9,320,987,655
 8,654,320,989
 7,987,654,323
 7,320,987,637
 6,654,320,991
 5,987,654,325
 5,320,987,659
 4,654,320,993
 3,987,654,327

For practice subtracting the numbers 1 through 6, practice this problem until the use of the secrets become automatic.

Set the number 9,999,999,999,999 and from it subtract the number 123,456,123,456 nine consecutive times to obtain these remainders.

9,876,543,876,543
 9,753,087,753,087
 9,629,631,629,631
 9,506,175,506,175
 9,382,719,382,719
 9,259,263,259,263
 9,135,807,135,807
 9,012,351,012,351
 8,888,894,888,895

SECRETS FOR SUBTRACTING SEVEN

Next study the secrets for subtracting 7.

Clear 1 left, Set 3

Clear 1 left, Set 5, Clear 2

1. Set 999

2. Clear 7

3. Clear 1 left, Set 5, Clear 2

4. Clear 1 left, Set 3

5. Clear 7

6. Clear 1 left, Set 3

7. Clear 1 left, Set 5, Clear 2

8. Clear 1

Etc.

Do these problems to practice subtracting 7.

$$\begin{array}{r}
 78 \quad 98 \quad 81 \quad 90 \quad 281 \quad 461 \quad 315 \quad 216 \quad 501 \quad 710 \quad 84 \quad 93 \quad 82 \\
 -77 \quad -77 \\
 \hline
 1 \quad 21 \quad \frac{1}{4} \quad 13 \quad 204 \quad 384 \quad 238 \quad 139 \quad 424 \quad 633 \quad 7 \quad 16 \quad 5
 \end{array}$$

$$\begin{array}{r}
 128 \quad 247 \quad 634 \quad 542 \quad 332 \quad 824 \quad 174 \quad 412 \quad 603 \quad 281 \quad 121 \quad 440 \\
 -77 \quad -77 \\
 \hline
 51 \quad 170 \quad 557 \quad 465 \quad 255 \quad 747 \quad 97 \quad 335 \quad 526 \quad 204 \quad 44 \quad 363
 \end{array}$$

$$\begin{array}{r}
 302 \quad 14731 \quad 56012 \\
 -77 \quad -7777 \quad -7777 \\
 \hline
 225 \quad 6954 \quad 48235
 \end{array}$$

Finally, set the number 9,987,654,321 and subtract from it the number 777,777,777 nine consecutive times obtaining these remainders:

9,209,876,544
8,432,098,767
7,654,320,990
6,876,543,213
6,098,765,436
5,320,987,659
4,543,209,882
3,765,432,105
2,987,654,328

SECRETS FOR SUBTRACTING EIGHT

Now study the secrets for subtracting 8.

Clear 1 left, Set 2

Clear 1 left, Set 5, Clear 3

1. Set 999
2. Clear 8
3. Clear 1 left, Set 2,
4. Clear 1 left, Set 5, Clear 3
5. Clear 1 left, Set 2
6. Clear 1 left, Set 2
7. Clear 8
8. Clear 1 left, Set 2
9. Clear 1 left, Set 5, Clear 3

Etc.

Do these problems in subtracting 8.

$$\begin{array}{r}
 98 & 89 & 91 & 125 & 161 & 450 & 371 & 625 & 807 & 265 & 93 & 94 \\
 -88 & -88 & -88 & -88 & -88 & -88 & -88 & -88 & -88 & -88 & -88 & -88 \\
 \hline
 10 & 1 & 3 & 37 & 73 & 362 & 283 & 537 & 719 & 177 & 5 & 6
 \end{array}$$

$$\begin{array}{r}
 143 & 243 & 633 & 834 & 443 & 544 & 734 & 241 & 623 & 236 & 147 \\
 -88 & -88 & -88 & -88 & -88 & -88 & -88 & -88 & -88 & -88 & -88 \\
 \hline
 55 & 155 & 545 & 746 & 355 & 456 & 646 & 153 & 535 & 148 & 59
 \end{array}$$

$$\begin{array}{r}
 24374 & 65463 & 53147 \\
 -8888 & -8888 & -8888 \\
 \hline
 15486 & 56575 & 44259
 \end{array}$$

Finally, set the number 9,987,654,321 and subtract from it the number 888,888,888 nine consecutive times obtaining these remainders.

9,098,765,433
 8,209,876,545
 7,320,987,657
 6,432,098,769
 5,543,209,881
 4,654,320,993
 3,765,432,105
 2,876,543,217
 1,987,654,329

SECRETS FOR SUBTRACTING NINE

Next look at the secrets for subtracting 9.

Clear 1 left, Set 1

Clear 1 left, Set 5, Clear 4

1. Set 999
2. Clear 9
3. Clear 1 left, Set 1
4. Clear 1 left, Set 1
5. Clear 1 left, Set 1
6. Clear 1 left, Set 1
7. Clear 1 left, Set 5, Clear 4

8. Clear 1 left, Set 1

9. Clear 1 left, Set 1

10. Clear 1 left, Set 1

11. Clear 1 left, Set 1

12. Clear 9

Etc.

For practice in subtracting 9, find these remainders:

$$\begin{array}{r} 199 \\ - 99 \\ \hline 289 \\ - 99 \\ \hline 487 \\ - 99 \\ \hline 363 \\ - 99 \\ \hline 572 \\ - 99 \\ \hline 781 \\ - 99 \\ \hline 405 \\ - 99 \\ \hline 370 \\ - 99 \\ \hline 144 \\ - 99 \\ \hline 344 \\ - 99 \\ \hline 124 \\ - 99 \\ \hline 604 \\ - 99 \end{array}$$

$$\begin{array}{r} 784 \\ - 99 \\ \hline 546 \\ - 99 \\ \hline 442 \\ - 99 \\ \hline 534 \\ - 99 \\ \hline 347 \\ - 99 \\ \hline 6943 \\ - 999 \\ \hline 2684 \\ - 999 \\ \hline 3041 \\ - 999 \\ \hline 6740 \\ - 999 \end{array}$$

Finally, set the number 9,987,654,321 and from it subtract the number 999,999,999 nine consecutive times obtaining these remainders.

8,987,654,322
7,987,654,323
6,987,654,324
5,987,654,325
4,987,654,326
3,987,654,327
2,987,654,328
1,987,654,329
987,654,330

ADDITIONAL PRACTICE

For extra practice in subtracting the numbers 1 through 9 set the number 9,999,999,909, and subtract from it the number 123,456,789 several consecutive times obtaining the following remainders:

$$\begin{array}{rcc} 9,999,999,909 & 6,666,666,606 & 3,333,333,303 \\ 9,876,543,120 & 6,543,209,817 & 3,209,876,514 \\ 9,753,086,331 & 6,419,753,028 & 3,086,419,725 \\ 9,629,629,542 & 6,296,296,239 & 2,962,962,936 \\ 9,506,172,753 & 6,172,839,450 & 2,839,506,147 \end{array}$$

| 6,790,123,395 | 3,456,790,092 | 123,456,789 |

After each intense practice using the secrets for subtraction, you may find that a review of the secrets for addition is necessary.

Return to the section on addition and study the secrets carefully.

Then return to this section and practice some of the problems again - first subtracting, and then adding again. For instance, $27 - 9 = 18$ then $18 + 9 = 27$. Next start with 9,999,999,909 as you did earlier.

This time, subtract 123,456,789 from it nine consecutive times to get 8,888,888,808. Then add 123,456,789 to that number nine times to get 9,999,999,909. Practice in this manner until you are confident in your use of the secrets for both addition and subtraction.

One other helpful exercise is to

$$\begin{array}{ll}
 \text{add} & 1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 = 45 \\
 \text{then to subtract} & 45 - 9 - 9 - 7 - 6 - 5 - 4 - 3 - 2 - 1 = 0 \\
 & 45 - 1 - 2 - 3 - 4 - 5 - 6 - 7 - 8 - 9 = 0
 \end{array}$$

$$\begin{array}{r}
 1 + 1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 = 46 \\
 46 - 1 - 2 - 3 - 4 - 5 - 6 - 7 - 8 - 9 = 1 \\
 1 + 9 + 8 + 7 + 6 + 5 + 4 + 3 + 2 + 1 = 46 \\
 46 - 9 - 8 - 7 - 6 - 5 - 4 - 3 - 2 - 1 = 1
 \end{array}$$

$$\begin{array}{r}
 2 + 1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 = 47 \\
 47 - 1 - 2 - 3 - 4 - 5 - 6 - 7 - 8 - 9 = 2 \\
 2 + 9 + 8 + 7 + 6 + 5 + 4 + 3 + 2 + 1 = 47 \\
 47 - 9 - 8 - 7 - 6 - 5 - 4 - 3 - 2 - 1 = 2
 \end{array}$$

$$\begin{array}{r}
 3 + 1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 = 48 \\
 48 - 1 - 2 - 3 - 4 - 5 - 6 - 7 - 8 - 9 = 3 \\
 3 + 9 + 8 + 7 + 6 + 5 + 4 + 3 + 2 + 1 = 48 \\
 48 - 9 - 8 - 7 - 6 - 5 - 4 - 3 - 2 - 1 = 3
 \end{array}$$

$$\begin{array}{r}
 4 + 1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 = 49 \\
 49 - 1 - 2 - 3 - 4 - 5 - 6 - 7 - 8 - 9 = 4 \\
 4 + 9 + 8 + 7 + 6 + 5 + 4 + 3 + 2 + 1 = 49 \\
 49 - 9 - 8 - 7 - 6 - 5 - 4 - 3 - 2 - 1 = 4
 \end{array}$$

$$\begin{array}{r}
 5 + 1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 = 50 \\
 50 - 1 - 2 - 3 - 4 - 5 - 6 - 7 - 8 - 9 = 5 \\
 5 + 9 + 8 + 7 + 6 + 5 + 4 + 3 + 2 + 1 = 50 \\
 50 - 9 - 8 - 7 - 6 - 5 - 4 - 3 - 2 - 1 = 5
 \end{array}$$

SUBTRACTION WITH DECIMALS

The same secrets are used in the subtraction of decimals as are used in the subtraction of whole numbers. As in addition, however, there is a specific procedure for determining the proper placement of decimal numbers on the abacus. This procedure for placing the numbers is the same as used in addition, and therefore, will not be dealt with in great detail here.

1. First find the number having the most decimal places.
2. If most decimal places is 3 or less, use first unit mark as decimal point.
3. If most decimal places is 4 to 6, use second unit mark as decimal point.

4. If most decimal places are 7 to 9, use third unit mark as decimal point.

Remember to set both the minuend and the subtrahend so that their decimal points fall in the proper position. Then merely use the secrets for subtraction which you have already mastered. Study the example below and work the following problems.

Example # 1

$$84.7259 - 6.409 =$$

Largest number of decimal places is 4, second unit mark is the decimal point.

84.7259 Set so that 4 is on column immediately to left 2nd unit mark.

- 6.408 Set so that 6 is on column immediately to left of 2nd unit mark.

78.3179 The remainder 8 is on column immediately to left of 2nd unit mark.

$$\begin{array}{r} 6.74 & 53.8 & 61.8 & 478.94 & 132.94 & 24.3 & 5.6431 & 63.87941 \\ -1.92 & -9.6 & -24.76 & -34.549 & -68.743 & -18.7 & -2.097 & -8.4379 \\ \hline 4.82 & 44.23 & 37.04 & 444.391 & 64.197 & 5.6 & 3.5561 & 55.44151 \end{array}$$

$$\begin{array}{r} 94.6 & 4.009 & 1.0007458 & 24.00068432 & 12.65 \\ -3.0075 & -2.0001 & .00643 & -6.5 & -8.0439 \\ \hline 91.5925 & 2.0089 & .9943158 & 17.50068432 & 4.6061 \end{array}$$

WHEN SUBTRAHEND IS LARGER THAN MINUEND

When the subtrahend is larger than the minuend, as for example, in the problem $47 - 94 =$, the problem can still be worked on the abacus. Use this procedure:

1. Set the subtrahend first 94.
2. Subtract from it, in the usual manner, the minuend 47.

3. Place a minus sign in front of the remainder -41. It is the correct answer.

Do these problems for practice:

$$\begin{array}{r} 14 & 35 & 71 & 24 & 42 & 12 & 643 & 247 & 891 & 687 & 421 & 4765 & 2714 \\ -65 & -94 & -96 & -61 & -75 & -34 & -851 & -596 & -964 & -860 & -568 & -6843 & -4623 \\ \hline -51 & -59 & -25 & -37 & -33 & -22 & -208 & -349 & -73 & -173 & -147 & -2078 & -1909 \end{array}$$

$$\begin{array}{r} 9642 & 6432 & 4761 \\ -9871 & -8465 & -9432 \\ \hline -229 & -2033 & -4671 \end{array}$$

DIVISION

Before we can discuss the procedures used in dividing on the abacus, it is essential that we understand the names of the various parts of the problem, their functions, and where they are placed on the abacus.

The divisor is the number that we divide into another number. It is set as far left on the abacus as possible. The dividend is the number into which we are dividing. It is set as far right on the abacus as possible. The quotient is the answer, and it is set on the columns to the left of the dividend. Exactly how it is positioned is a very important concept and must be thoroughly understood before proceeding.

When dividing with a one-digit divisor, if the divisor can be divided into the first digit of the dividend ($6 \div 3$, $34 \div 2$, $746 \div 4$) then the quotient is placed on the second column to the left of the dividend. If the one-digit divisor can not be divided into the first digit of the dividend ($18 \div 6$, $247 \div 7$, $438 \div 6$) then the quotient is placed on the column immediately to the left of the dividend.

When dividing with a two-digit divisor, if the divisor can be divided into the first two digits of the dividend ($36 \div 18$, $516 \div 24$), then the quotient is placed on the second column to the left of the dividend. If the two-digit divisor cannot be divided into the first two digits of the dividend ($146 \div 18$, $428 \div 50$), then the quotient is set on the column immediately to the left of the dividend.

When three-digit divisor is used, if it can be divided into the first three digits of the dividend, the quotient is set on the second column to the left; if it cannot, it is set immediately to the left.

The concept is the same for larger divisors.

ONE-DIGIT DIVISORS

First, we will consider division problems having only one digit in the divisor, and one, two, three, or more digits in the dividend. Follow the following procedure carefully to work the first example. Remember to set and clear with the proper fingers.

$$8 : 4 =$$

1. Set the divisor (4) on the column farthest left.
2. Set the dividend (8) on the column farthest right.
3. Divide the dividend (8) by the divisor (4). Set the quotient (2) on the second column to the left of the dividend. (8)
(Remember when a one-digit divisor can be divided into the first digit of the dividend, the quotient is set on the second column to the left of the dividend.)
4. Multiply the quotient (2) times the divisor (4). (Remember that in multiplication, one-digit products are set in the second column of the position.) Subtract product (8) from the dividend (8).
5. The final quotient (2) is now shown on the abacus. We know that the quotient is 2 and not 20, or 200, by determining

which column is the last one in the product. To determine this, we add the number of digits in the divisor (1) plus one more. In this case the sum is 2. We then count off two columns from the right edge of the abacus. The next column to the left is the last digit of the quotient.

Divide these problems. Concentrate on establishing as habit the simple procedure above. Doing so will help when you begin to divide larger numbers.

$$6 \div 3 = 2$$

$$2 \div 1 = 2$$

$$6 \div 6 = 1$$

$$9 \div 3 = 3$$

$$3 \div 3 = 1$$

$$5 \div 5 = 1$$

$$6 \div 2 = 3$$

$$8 \div 8 = 1$$

$$4 \div 4 = 1$$

$$4 \div 2 = 2$$

$$8 \div 2 = 4$$

$$3 \div 3 = 1$$

Now study carefully this example which still has a one-digit divisor but a two-digit dividend.

$$18 \div 6 =$$

1. Set the divisor (6) on the column farthest left.

2. Set the dividend (18) on the two columns farthest right.

3. Divide the dividend (18) by the divisor (6). Set the quotient (3) on the column immediately to the left of the dividend (18) (Remember, when a one-digit divisor can not be divided into the first digit of the dividend the resulting quotient is set in the column immediately to the left of the dividend.)

4. Multiply the quotient (3) times the divisor (6). Subtract the product (18) from the dividend (18) which is, of

course, in the first position to the right.

5. The final quotient (3) is now shown on the abacus. Again, one digit in the divisor plus one more = 2, and thus the last digit of the quotient is in the 3rd column from the right.

Practice these problems before studying the next example.

$$12 \div 3 = 4$$

$$48 \div 6 = 8$$

$$16 \div 4 = 4$$

$$21 \div 7 = 3$$

$$63 \div 7 = 9$$

$$72 \div 8 = 9$$

$$36 \div 4 = 9$$

$$81 \div 9 = 9$$

$$30 \div 6 = 5$$

$$56 \div 8 = 7$$

$$24 \div 6 = 4$$

$$20 \div 4 = 5$$

$$15 \div 5 = 3$$

$$40 \div 5 = 8$$

$$64 \div 8 = 8$$

The next example also has a one-digit divisor and a two-digit dividend, but now the divisor can be divided into the first digit of the dividend. Therefore two divisions must be made.

$$86 \div 2 =$$

1. Set the divisor (2) on the column farthest left.

2. Set the dividend (86) on the columns farthest right.

3. Divide the divisor (2) into the first digit of the dividend (8) and set the quotient (4) on the second column to the left of the dividend (one-digit divisor can be divided into first digit of dividend).

4. Multiply the quotient (4) times the divisor (2) and subtract the product (8) from the first digit of the dividend (8).

(Notice the product is one-digit and is subtracted from the 2nd column of the first position.)

5. Divide the divisor (2) into the now first digit of the dividend (6). Set the quotient (3) in the second column to the left of the remaining dividend. (One-digit divisor can again be divided into now first digit of dividend.)

6. Multiply the last quotient (3) times the divisor (2) and subtract the product (6) from the first digit of the remaining dividend.

7. The answer (43) is now shown on the abacus.

Do these problems for practice. Remember to determine which column is the last in the product.

$$48 \div 4 = 12$$

$$66 \div 6 = 11$$

$$93 \div 3 = 31$$

$$69 \div 3 = 23$$

$$39 \div 3 = 13$$

$$60 \div 3 = 20$$

$$55 \div 5 = 11$$

$$84 \div 4 = 21$$

$$80 \div 8 = 10$$

$$28 \div 2 = 14$$

$$77 \div 7 = 11$$

$$20 \div 2 = 10$$

Now study carefully the following example - one minor difference is noted.

$$72 \div 4 =$$

1. Set the divisor (4) on the column farthest left.
2. Set the dividend (72) on the columns farthest right.
3. Divide the divisor (4) into the first digit of the dividend (7) Set the quotient (1) on the second column to the left.
4. Multiply the quotient (1) times the divisor (4); subtract the product (4) from the first position. (Notice that sub-

tracting the product (4) does not, in this case, clear the entire first digit of the dividend as it has in all previous cases. Notice also that the division procedure doesn't change significantly. The remainder, after subtracting the product, merely becomes the first digit of the remaining dividend, and the division process continues as before).

5. Divide the divisor (4) into the now first two digits of the dividend (32). Set the quotient (8) in the column immediately to the left.
6. Multiply the quotient (8) times the divisor (4), subtract product (32) from the first position.
7. The answer, 18, is now shown on the abacus.

Work these problems for practice.

$$65 \div 5 = 13$$

$$72 \div 6 = 12$$

$$98 \div 7 = 14$$

$$72 \div 4 = 18$$

$$84 \div 3 = 28$$

$$91 \div 7 = 13$$

$$96 \div 6 = 16$$

$$48 \div 3 = 16$$

$$96 \div 8 = 12$$

$$50 \div 2 = 25$$

$$96 \div 4 = 24$$

$$85 \div 5 = 17$$

$$70 \div 5 = 14$$

$$68 \div 4 = 17$$

Next we will consider problems with one-digit divisors and three-or-more-digit dividends. The principles of division learned so far remain important - the only real difference is that more divisions are

required to work these larger problems.

Study these examples carefully before working the next group of problems.

$$216 \div 3 =$$

1. Set the divisor (3) on the column farthest left.
2. Set the dividend (216) on the columns farthest right.
3. Divide the divisor (3) into the first two digits of the dividend (21) and set the quotient (7) on the column immediately to the left.
4. Multiply the quotient (7) times the divisor (3) and subtract the product (21) from the first position which is the first two digits of the dividend (21).
5. Divide the divisor (3) into the first digit of the remaining dividend (6) and set the quotient (2) in the second column to the left.
6. Multiply the last quotient (2) times the divisor (3) and subtract the product (6) from the now first position.
7. The answer (72) is now shown on the abacus.

$$864 \div 2$$

1. Set the divisor (2) on the column farthest left.
2. Set the dividend (864) on the column farthest right.
3. Divide the divisor (2) into the first digit of the dividend (8) and set the quotient (4) on the second column to the left.

4. Multiply the quotient (4) times the divisor (2); subtract the product (8) from the first position.
5. Divide the divisor (2) into the now first digit of the dividend (6); set the quotient (3) on the second column to the left.
6. Multiply that quotient (3) times the divisor (2); subtract the product (6) from the now first position.
7. Divide the divisor (2) into the now first digit of the dividend (4); set the quotient (2) on the second column to the left.
8. Multiply the quotient (2) times the divisor (2); subtract the product (4) from the first position.
9. The answer (432) is now shown on the abacus.

812 \div 4 =

1. Set the divisor (4) on the column farthest left.
2. Set the dividend (812) on the column farthest right.
3. Divide the divisor (4) into the first digit of the dividend (8). Set the quotient (2) on the second column to the left.
4. Multiply the quotient (2) times the divisor (4); subtract the product (8) from the first position.
5. Divide the divisor (4) into the remaining two digits of the dividend (12); set the quotient (3) on the column immediately to the left.

6. Multiply the quotient (3) times the divisor (4); subtract the product from the now first position.

7. The answer, 203, is now shown on the abacus.

$196 \div 7 =$

1. Set the divisor (7) on the column farthest left.

2. Set the dividend (196) on the columns farthest right.

3. Divide the divisor (7) into the first two digits of the dividend (19); set the quotient (2) on the column immediately to the left.

4. Multiply the quotient (2) times the divisor (7); subtract the product (14) from the first position. (Notice that this subtraction does not completely clear the first two digits of the dividend. The remainder of 5 becomes the first digit of the dividend (56) and the division process continues.)

5. Divide the divisor (7) into the dividend (56); set the quotient (8) on the column immediately to the left.

6. Multiply the quotient (8) times the divisor (7); subtract the product (56) from the first position.

7. The answer, 28, is now shown on the abacus.

Once you understand the procedures described in the examples above, work the following problems for practice. Remember to determine which column is the last one in the product.

| | | |
|--------------------------|-----------------------------|-------------------------|
| 693 \div 3 = 231 | 2864 \div 2 = 1432 | 3876 \div 4 = 969 |
| 186 \div 6 = 31 | 6186 \div 6 = 1031 | 3416 \div 7 = 488 |
| 318 \div 3 = 106 | 3045 \div 5 = 609 | 8386 \div 7 = 1198 |
| 287 \div 7 = 41 | 8872 \div 8 = 1109 | 56826 \div 3 = 18942 |
| 540 \div 5 = 180 | 4974 \div 6 = 829 | 70216 \div 8 = 8777 |
| 540 \div 9 = 60 | 5284 \div 4 = 1321 | 60345 \div 5 = 12069 |
| 328 \div 4 = 82 | 1269 \div 9 = 141 | 836154 \div 9 = 92906 |
| 840 \div 8 = 105 | 8865 \div 3 = 2955 | 278128 \div 4 = 69532 |
| 700164 \div 6 = 116694 | 2791268 \div 4 = 697817 | |
| 238200 \div 3 = 79400 | 4104000 \div 8 = 513000 | |
| 747000 \div 9 = 83000 | 8301564 \div 6 = 1383594 | |
| 700140 \div 7 = 100020 | 44295065 \div 5 = 8859013 | |

REMAINDERS

Thus far in our discussion of division, all problems have divided evenly, and we have had no remainders. Problems with remainders are worked in exactly the same way as those we have already discussed. When all divisions have been made, we, as usual, determine which column is the last one in the quotient - any numbers to the right of that are the remainder.

Study the following example; then work the problems below.

$$435 \div 6 =$$

1. Set the divisor (6) on the column farthest left.
2. Set the dividend (435) on the column farthest right.

3. Divide the divisor (6) into the first two digits of the dividend (43). Set the quotient (7) on the column immediately to the left.

4. Multiply the quotient (7) times the divisor (6); subtract the product (42) from the first position.

5. Divide the divisor (6) into the now first two digits of the dividend (15); set the quotient (2) on the column immediately to the left.

6. Multiply the quotient (2) times the divisor (6); subtract the product (12) from the first position.

7. Determine which is the last column of the quotient - the answer 72 r3 is now shown on the abacus.

$$475 \div 6 = 79 \text{ r}1$$

$$510 \div 8 = 63 \text{ r}6$$

$$67947 \div 6 = 11324 \text{ r}3$$

$$587 \div 4 = 146 \text{ r}3$$

$$510 \div 4 = 127 \text{ r}2$$

$$320017 \div 8 = 40002 \text{ r}1$$

$$679 \div 8 = 84 \text{ r}7$$

$$6109 \div 6 = 1018 \text{ r}1$$

$$660045 \div 4 = 165011 \text{ r}1$$

$$738 \div 5 = 147 \text{ r}3$$

$$2106 \div 7 = 300 \text{ r}6$$

$$54092 \div 3 = 18030 \text{ r}2$$

$$687 \div 9 = 76 \text{ r}3$$

$$2702 \div 3 = 900 \text{ r}2$$

$$15003 \div 5 = 3000 \text{ r}3$$

$$596 \div 7 = 85 \text{ r}1$$

$$45004 \div 5 = 9000 \text{ r}4$$

$$28074 \div 7 = 4010 \text{ r}4$$

For additional practice in dividing with a one-digit divisor, work these sets of problems:

$$4782969 \div 9 = 531441$$

$$2097152 \div 8 = 262144$$

$$823543 \div 7 = 117649$$

$$531441 \div 9 = 59049$$

$$262144 \div 8 = 32768$$

$$117649 \div 7 = 16807$$

$$59049 \div 9 = 6561$$

$$32768 \div 8 = 4096$$

$$16807 \div 7 = 2401$$

$$6561 \div 9 = 729$$

$$4096 \div 8 = 512$$

$$2401 \div 7 = 343$$

$$729 \div 9 = 81$$

$$512 \div 8 = 64$$

$$343 \div 7 = 49$$

$$81 \div 9 = 9$$

$$64 \div 8 = 8$$

$$49 \div 7 = 7$$

$$9 \div 9 = 1$$

$$8 \div 8 = 1$$

$$7 \div 7 = 1$$

| | | |

TWO-OR-MORE-DIGIT DIVISORS

Division with two-or-more digits in the divisor follows much the same pattern as division with a one-digit divisor. A few steps are added to the procedure to deal with the added digits in the divisor, and these will be exemplified and explained below. Also, when dealing with two-or-more digit divisors, it is easy to mis-estimate when dividing, and ~~choose~~ ^{choose} a quotient which is either too large or too small. Ways for correcting such mis-estimates will be discussed.

Consider first a problem with a two-digit divisor and a two-digit dividend.

98 ÷ 14 =

1. Set the divisor (14) on the columns farthest left.
2. Set the dividend (98) on the column farthest right.
3. Divide the divisor (14) into the first two digits of the dividend (98) set the quotient (7) on the second column to the left of the dividend. (Recall that when a two-digit divisor can be divided into the first two digits of the dividend, the quotient is placed on the second column to the left.)
4. Multiply the quotient (7) times the first digit of the divisor (1) subtract the product (7) from the first position.
5. Multiply the quotient (7) times the second digit of the divisor (4); subtract the product (28) from the second position. (Notice that the position concept of multiplication is an integral part of division and must be used correctly.)
6. The answer, 7, is now shown on the abacus. (Finally, remember how to determine which is the last column of the quotient: number of digits in the divisor (2) plus one = three. Count in three columns from the right edge of the abacus - the next column to the left is the last digit of the quotient.)

Work the following problems for practice. Some of them will have remainders: and, as before, after determining which is the last column of the quotient, any number to the right of that column will

represent a remainder.

| | | | |
|------------------|------------------|------------------------------|-----------------------------|
| $32 \div 16 = 2$ | $84 \div 42 = 2$ | $99 \div 14 = 7 \text{ r}1$ | $63 \div 31 = 2 \text{ r}1$ |
| $75 \div 25 = 3$ | $54 \div 27 = 2$ | $98 \div 47 = 2 \text{ r}4$ | $54 \div 12 = 4 \text{ r}6$ |
| $84 \div 21 = 4$ | $90 \div 18 = 5$ | $59 \div 19 = 3 \text{ r}2$ | $73 \div 18 = 4 \text{ r}1$ |
| $96 \div 24 = 4$ | $92 \div 23 = 4$ | $68 \div 13 = 5 \text{ r}3$ | $87 \div 17 = 5 \text{ r}2$ |
| $30 \div 10 = 3$ | $94 \div 47 = 2$ | $46 \div 12 = 3 \text{ r}10$ | $39 \div 16 = 2 \text{ r}7$ |
| $45 \div 15 = 3$ | $74 \div 37 = 2$ | $78 \div 25 = 3 \text{ r}3$ | $76 \div 15 = 5 \text{ r}1$ |
| $39 \div 13 = 3$ | $69 \div 23 = 3$ | $71 \div 11 = 6 \text{ r}5$ | $24 \div 11 = 2 \text{ r}2$ |
| $70 \div 35 = 2$ | $57 \div 19 = 3$ | $38 \div 15 = 2 \text{ r}8$ | $48 \div 13 = 3 \text{ r}9$ |

CORRECTING MIS-ESTIMATES

As you may have already discovered in working the above problems, it is easy to mis-estimate and choose a quotient that is either too high or too low. It is, however, possible to correct such mis-estimates without starting the problem over. First, we will consider problems where the estimated quotient is too low. In our last example, we found the quotient of $98 \div 14$ to be 7. Suppose, however, in $98 \div 14 =$ we had estimated the quotient to be 6.

1. Set the divisor (14) on the columns farthest left.
2. Set the dividend (98) on the columns farthest right.
3. Divide the divisor (14) into the first two digits of the dividend (98). Set the quotient (which we estimate at 6) on the second column to the left.
4. Multiply the quotient (6) times the first digit of the divisor (1); subtract the product (6) from the first position (leaving 38 in the dividend)

5. Multiply the quotient (6) times the second digit of the divisor (4); subtract the product (24) from the second position, (leaving 14 in the dividend).

At this point, we realize that our quotient estimate (6) was too low because the divisor (14) can be divided into the remainder (14).

To correct this under-estimation:

6. Divide the divisor (14) into the remaining dividend (14).

As usual set the quotient (1) on the second column to the left.

7. Multiply the quotient (1) times the first digit of the divisor (1); subtract the product (1) from the first position (leaving 4 in the dividend).

8. Multiply the quotient (1) times the second digit of the divisor (4); subtract the product (4) from the second position.

9. The answer (7) is now shown on the abacus.

To practice correcting under-estimates, work the following problems choosing the estimated quotient (EQ) indicated; then correcting to find the correct quotient (CQ).

$$84 \div 21 = \frac{\text{EQ}}{3} \quad \frac{\text{CQ}}{4}$$

$$96 \div 24 = 3 \quad 4$$

$$39 \div 13 = 2 \quad 3$$

$$90 \div 18 = 3 \quad 5$$

$$92 \div 23 = 2 \quad 4$$

$$99 \div 14 = \frac{\text{EQ}}{5} \quad \frac{\text{CQ}}{7} \text{ r1}$$

$$68 \div 13 = 3 \quad 5 \text{ r3}$$

$$46 \div 12 = 2 \quad 3 \text{ r10}$$

$$71 \div 11 = 4 \quad 6 \text{ r5}$$

$$54 \div 12 = 3 \quad 4 \text{ r6}$$

$$74 \div 37 = \frac{\text{EQ}}{1} \quad \frac{\text{CQ}}{2}$$

$$69 \div 23 = 2 \quad 3$$

$$57 \div 19 = 2 \quad 3$$

$$87 \div 17 = \frac{\text{EQ}}{3} \quad \frac{\text{CQ}}{5} \text{ r}2$$

$$39 \div 16 = 1 \quad 2 \text{ r}7$$

$$48 \div 13 = 2 \quad 3 \text{ r}9$$

Next we will consider problems where the estimated quotients are too high. Again we will use the problem $98 \div 14 = 7$, but this time our estimated quotient will be 8.

1. Set the divisor (14) on the columns farthest left.
2. Set the dividend (98) on the columns farthest right.
3. Divide the divisor (14) into the dividend (98); set the quotient (estimated to be 8) on the second column to the left.
4. Multiply the quotient (8) times the first digit of the divisor (1); subtract the product (8) from the first position (leaving 18 in the dividend).
5. Multiply the quotient (8) times the second digit of the divisor (4); subtract the product (32) from the second position (not possible).

It is at this point that we realize our estimated quotient is too high because the product of our last multiplication (32) cannot be subtracted from the remaining dividend (18). We then re-estimate the quotient to be 7, then:

6. Clear 1 from the estimated-quotient to obtain the re-estimation (7).

Because we had already multiplied the estimated quotient (8) times

the first digit of the divisor (1), and because we had already subtracted that product (8) from the first position, we must now correct the error by:

7. Multiply the number cleared from the estimated quotient (1) times whichever digits of the divisor were multiplied earlier by the incorrect estimated quotient (in this case, the first digit of the divisor (1) was the only one multiplied earlier). Add that product ($1 \times 1 = 1$) to the first position.

Now we continue on with the division process where we left off when we discovered our error in estimating the quotient, i.e., after multiplying the quotient times the first digit of the divisor. Thus, we now:

8. Multiply the new quotient (7) times the second digit of the divisor (4). Subtract the product (28) from the second position.

9. The answer 7, is now shown on the abacus.

The example discussed above for correcting over-estimations should be studied carefully and worked several times so that the procedures are thoroughly memorized. Next work the following problems using the given estimated quotients first, and then use the procedure for correcting mis-estimates to obtain the correct quotient.

$$\begin{array}{rcl}
 90 \div 18 = \frac{EQ}{6} \frac{CQ}{5} & & 94 \div 18 = \frac{EQ}{7} \frac{CQ}{5} r4 \\
 57 \div 19 = 4 \quad 3 & & 98 \div 15 = 7 \quad 6 \quad r8 \\
 85 \div 17 = 7 \quad 5 & & 96 \div 13 = 8 \quad 7 \quad r5 \\
 92 \div 16 = 7 \quad 5 \quad r12 & & 89 \div 17 = 6 \quad 5 \quad r4 \\
 90 \div 15 = 8 \quad 6 & & 98 \div 16 = 8 \quad 6 \quad r2 \\
 91 \div 13 = 8 \quad 7 & & 99 \div 19 = 7 \quad 5 \quad r4 \\
 99 \div 14 = 8 \quad 7 \quad r1 & & 78 \div 19 = 5 \quad 4 \quad r2
 \end{array}$$

Now that you have learned how to correct both under and over-estimations, we can go on to consider larger division problems.

There will be no more sets of exercises to practice corrections, but throughout the remainder of this unit on division you should continue to use the procedure for correcting mis-estimations whenever necessary.

Next we will consider problems having two-digit divisors and three digit dividends. Study the examples below and then do the practice exercises.

$$156 \div 39 = 4$$

1. Set the divisor (39) left.
2. Set the dividend (156) right.
3. Divide the divisor (39) into the dividend (156); set the quotient (4) on the column immediately to the left of the dividend. (When a two-digit divisor can not be divided into the first two digits of the dividend, the quotient is set on the column immediately to the left.)

4. Multiply the quotient (4) times the first digit of the divisor (3). Subtract the product (12) from the first position.
5. Multiply the quotient (4) times the second digit of the divisor (9). Subtract the product (36) from the second position.
6. The answer (4) is now shown on the abacus.

$$351 \div 27 = 13$$

1. Set the divisor (27) to the left.
2. Set the dividend (351) to the right.
3. Divide the divisor (27) into the first two digits of the dividend (35); set the quotient (1) in the second column to the left.
4. Multiply the quotient (1) times the first digit of the divisor (2). Subtract the product (2) from the first position.
5. Multiply the quotient (1) times the second digit of the divisor (7). Subtract the product (7) from the second position.
6. Divide the divisor (27) into the new dividend. (81). Set the quotient (3) on the second column to the left.
7. Multiply the quotient (3) times the first digit of the divisor (2). Subtract the product (6) from the first position.
8. Multiply the quotient (3) times the second digit of the divisor (7). Subtract the product (21) from the second position.
9. The answer (13) is now shown on the abacus.

$$658 \div 94 = 7$$

$$196 \div 14 = 14$$

$$387 \div 42 = 9 \text{ r}9$$

$$148 \div 37 = 4$$

$$558 \div 31 = 18$$

$$485 \div 27 = 17 \text{ r}26$$

$$268 \div 67 = 4$$

$$444 \div 12 = 37$$

$$987 \div 13 = 75 \text{ r}12$$

| | | |
|--------------------|--------------------------------|--------------------------------|
| $568 \div 71 = 8$ | $325 \div 25 = 13$ | $612 \div 84 = 7 \text{ r}24$ |
| $282 \div 47 = 6$ | $512 \div 16 = 32$ | $872 \div 15 = 58 \text{ r}2$ |
| $292 \div 73 = 4$ | $630 \div 42 = 15$ | $763 \div 54 = 14 \text{ r}7$ |
| $168 \div 28 = 6$ | $612 \div 12 = 51$ | $295 \div 36 = 8 \text{ r}7$ |
| $364 \div 52 = 7$ | $630 \div 10 = 63$ | $345 \div 13 = 26 \text{ r}7$ |
| $195 \div 39 = 5$ | $420 \div 42 = 10$ | $574 \div 68 = 8 \text{ r}30$ |
| $320 \div 64 = 5$ | $930 \div 31 = 30$ | $786 \div 26 = 30 \text{ r}6$ |
| $414 \div 46 = 9$ | $480 \div 24 = 20$ | $732 \div 18 = 40 \text{ r}12$ |
| $225 \div 75 = 3$ | $600 \div 12 = 50$ | $694 \div 34 = 20 \text{ r}14$ |
| $150 \div 32 = 5$ | $640 \div 16 = 40$ | $278 \div 27 = 10 \text{ r}8$ |
| $672 \div 21 = 32$ | $738 \div 64 = 11 \text{ r}34$ | $479 \div 16 = 29 \text{ r}15$ |

Next consider problems having a two-digit divisor and a dividend of four or more digits. Because the procedure for dividing does not change except to add more of the same steps, there will be no example.

Work the problems below to solidify your understanding of division with two-digit divisors.

| | | |
|---------------------|----------------------|-----------------------|
| $1092 \div 39 = 28$ | $3160 \div 79 = 40$ | $4503 \div 19 = 237$ |
| $2714 \div 46 = 59$ | $4270 \div 61 = 70$ | $4872 \div 24 = 203$ |
| $4956 \div 59 = 84$ | $2700 \div 90 = 30$ | $9246 \div 23 = 402$ |
| $8245 \div 85 = 97$ | $4000 \div 50 = 80$ | $4912 \div 16 = 307$ |
| $9801 \div 99 = 99$ | $5778 \div 18 = 321$ | $7106 \div 34 = 209$ |
| $4914 \div 78 = 63$ | $8435 \div 35 = 241$ | $26901 \div 63 = 427$ |
| $3192 \div 42 = 76$ | $6552 \div 36 = 182$ | $15562 \div 31 = 502$ |

$$1825 \div 25 = 741$$

$$217728 \div 32 = 6804$$

$$679473 \div 48 = 14155 \text{ r}33$$

$$98901 \div 99 = 999$$

$$195273 \div 39 = 5007$$

$$349682 \div 27 = 12951 \text{ r}5$$

$$187461 \div 27 = 6943$$

$$153600 \div 50 = 3072$$

$$741319 \div 35 = 21180 \text{ r}19$$

$$292373 \div 61 = 4793$$

$$260000 \div 40 = 6500$$

Problems having three-or-more digit divisors are worked according to the same principles used thus far. Study the following example; then work the problem below.

$$5829 \div 374 = 15 \text{ r}219$$

1. Set the divisor (374) to the far left.
2. Set the dividend (5829) to the far right.
3. Divide the divisor (374) into the first three digits of the dividend (582); set the quotient (1) in the second column to the left of the dividend. (Recall that if a three digit divisor can be divided into the first three digits of the dividend, the quotient is set on the second column to the left.)
4. Multiply the quotient (1) times the first digit of the divisor (3); subtract the product from the first position.
5. Multiply the quotient (1) times the second digit of the dividend (7); subtract the product (7) from the second position.
6. Multiply the quotient (1) times the third digit of the dividend (4); subtract the product (4) from the third position.

7. Divide the divisor (374) into the remaining dividend (208). Set the quotient (5) on the column immediately to the left. (If a three-digit divisor can not be divided into the first three digits of the dividend. The quotient is set on the column immediately left.)

8. Multiply the quotient (5) times the first digit of the divisor (3). Subtract the product (15) from the first position.

9. Multiply the quotient (5) times the second digit of the divisor (7). Subtract the product (35) from the second position.

10. Multiply the quotient (5) times the third digit of the divisor (4). Subtract the product (20) from the third position.

11. The answer, (15 r219) is now shown on the abacus.

| | | |
|------------------------|--------------------------------------|---|
| $4508 \div 196 = 23$ | $44,454 \div 239 = 186$ | $71,042 \div 4287 = 16 \text{ r}2450$ |
| $8494 \div 274 = 31$ | $165,282 \div 326 = 507$ | $187,765 \div 1356 = 138 \text{ r}637$ |
| $5576 \div 328 = 17$ | $158,762 \div 487 = 326$ | $852,183 \div 2791 = 126 \text{ r}517$ |
| $10,056 \div 419 = 24$ | $348,000 \div 580 = 600$ | $918,673 \div 246 = 3734 \text{ r}109$ |
| $20,520 \div 684 = 30$ | $285,640 \div 386 = 740$ | $291,647 \div 683 = 427 \text{ r}6$ |
| $43,200 \div 720 = 60$ | $47,894 \div 591 = 81 \text{ r}23$ | $824,792 \div 384 = 2147 \text{ r}344$ |
| $32,000 \div 400 = 80$ | $67,432 \div 428 = 157 \text{ r}236$ | $825,864 \div 2971 = 277 \text{ r}2897$ |

ADDITIONAL PRACTICE

For additional practice in division, try these interesting problems.

$$2,222,222,202 \div 18 = 123,456,789$$

$$3,333,333,303 \div 27 = 123,456,789$$

$$4,444,444,404 \div 36 = 123,456,789$$

$$5,555,555,505 \div 45 = 123,456,789$$

$$6,666,666,606 \div 54 = 123,456,789$$

$$7,777,777,707 \div 63 = 123,456,789$$

$$8,888,888,808 \div 72 = 123,456,789$$

$$9,999,999,909 \div 81 = 123,456,789$$

DIVISION OF DECIMALS

If the number of decimal places in the dividend is greater than or equal to the number of decimal places in the divisor, then the procedure for division remains the same. We simply treat both numbers as whole numbers. Once the quotient is found, we subtract the number of decimal places in the divisor from the number of decimal places in the dividend; the difference indicates the number of decimal places that must be pointed off in the quotient. The example below illustrates this point.

$$5.69 \quad 4.7 = 1.2 \text{ r}5$$

1. Set the divisor (47) to the far left.
2. Set the dividend (569) to the far right.
3. Divide the divisor (47), into the first two digits of the dividend (56); set the quotient (1) on the second column to the left.
4. Multiply the quotient (1) times the first digit of the divisor (4); subtract the product (4) from the first position.
5. Multiply the quotient (1) times the second digit of the divisor (7); subtract the product (7) from the second position.

6. Divide the divisor (47) into the first two digits of the remaining dividend (99) set the quotient (2) on the second column to the left.
7. Multiply the quotient (2) times the first digit of the divisor (4); subtract the product (8) from the first position.
8. Multiply the quotient (2) times the second digit of the divisor (7); subtract the product (14) from the second position.
9. The answer 12 r5 is now shown on the abacus: dividend had two decimal places. We subtract the one decimal place in the divisor from the two decimal places in the dividend and find we must point off one decimal place in the quotient - thus, our final answer is 1.2 r5.

If, however, there are fewer decimal places in the dividend than in the divisor, then we must add as many zeroes to the dividend as there are fewer decimal places. We then divide as usual and, since we now have an equal number of decimal places, in both dividend and divisor. There are no places to be pointed off in the quotient. Study the example below.

$$791 \div 3.5 = 226$$

Because the dividend has one fewer decimal places than the divisor, we must add that many (1) zeroes to it before setting. Thus when we consider the divisor and dividend as whole numbers, we have 35 and 7910 respectively.

1. Set the divisor (35) to the far left.
2. Set the dividend (7910) to the far right.

3. Divide the divisor (35) into the first two digits of the dividend (79). Set the quotient (2) on the second column to the left.
4. Multiply the quotient (2) times the first digit of the divisor (3). Subtract the product (6) from the first position.
5. Multiply the quotient (2) times the second digit of the divisor (5). Subtract the product (10) from the second position.
6. Divide the divisor (35) into the first two digits of the remaining dividend (91). Set the quotient (2) on the second column to the left.
7. Multiply the quotient (2) times the first digit of the divisor (3). Subtract the product (6) from the first position.
8. Multiply the quotient (2) times the second digit of the divisor (5). Subtract the product (10) from the second position.
9. Divide the divisor (35) into the first three digits of the remaining dividend (210); set the quotient (6) on the column immediately to the left.
10. Multiply the quotient (6) times the first digit of the divisor (3). Subtract the product (18) from the first position.
11. Multiply the quotient (6) times the second digit of the divisor (5). Subtract the product (30) from the second position.
12. The answer (226) is now shown on the abacus. Because we added

zeroes to the dividend until the number of decimal places in the dividend was equal to the number in the divisor, there is no difference between the two, and thus, no decimal places to be pointed off in the answer.

Work these problems for practice in dividing with decimals.

$$35.67 \div 6.8 = 5.2 \text{ r}31$$

$$84 \div 6 = 840 \div 6 = 140$$

$$6.59 \div 4.7 = 1.4 \text{ r}1$$

$$48 \div 7 = 480 \div 7 = 68 \text{ r}4$$

$$78.4 \div .8 = 98$$

$$26.8 \div .49 = 26.80 \div 49 = 54 \text{ r}34$$

$$8.996 \div 3.91 = 2.3 \text{ r}3$$

$$68 \div .28 = 6800 \div 28 = 242 \text{ r}24$$

$$38.6 \div .42 = 91 \text{ r}38$$

$$70 \div .321 = 70000 \div 321 = 218 \text{ r}22$$

FRACTIONS

In a fraction, such as $2/5$, $8/3$, $7/10$, $4/4$ etc., we know that the number below the line, the denominator, indicates how many equal parts a whole is divided into; and we know that the number above the line, the numerator, indicates how many of these equal parts we are to consider. When a number includes both a whole number and a fraction, it is called a mixed number.

Fractions and mixed numbers can be added, subtracted, multiplied, and/or divided as can whole numbers. Sometimes it is necessary to reduce fractions such as $4/8$, $6/9$, $12/48$ or $15/15$ which have not been written in their lowest terms.

When reducing, adding, or subtracting fractions or mixed numbers, the abacus is divided into three sections - one each for the denominator, numerator, and whole number. Beginning at the extreme right of the abacus, the first three columns are the section for the denominator. The denominator is always written as far right in the section as possible: thus a one-digit denominator (3 or 9) is always written on the first column from the right, a two-digit denominator (48 or 15) is always written on columns 1 and 2 from the right, and a three digit denominator is written on columns 1, 2, and 3 from the right.

The next three columns (columns 4, 5, and 6 from the right) are the section for the numerator. The numerator, like the denominator, is set as far right within its own section as is possible: thus a one-digit numerator is always set on column 4 from the right.

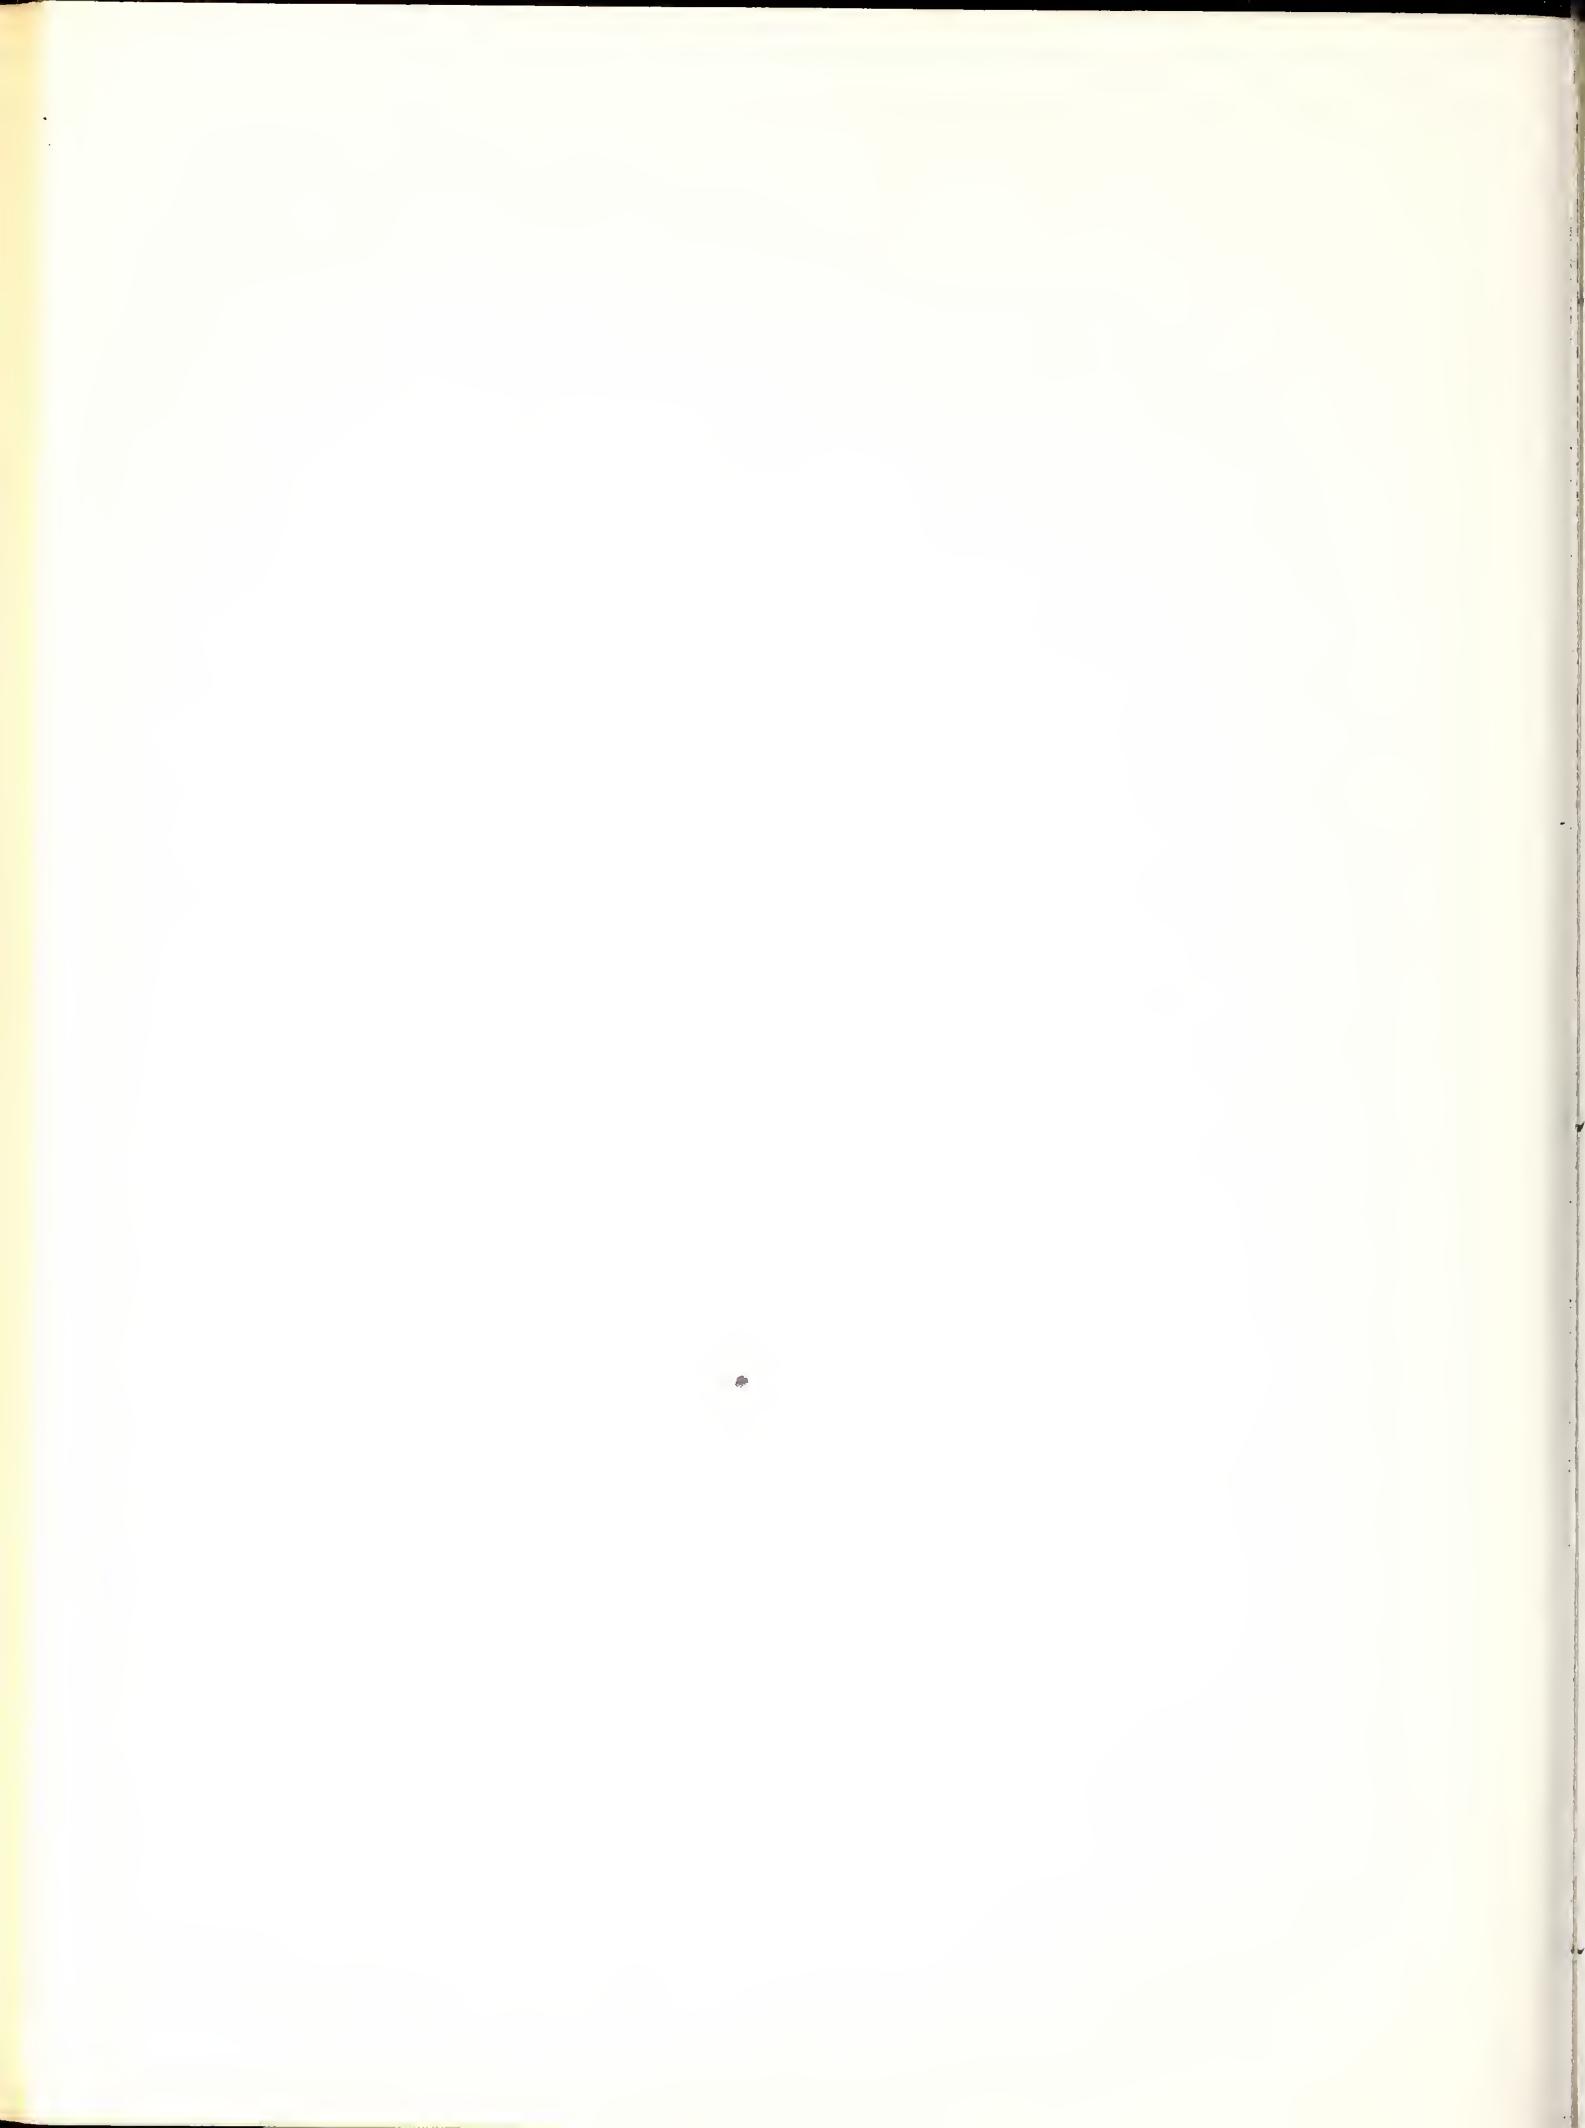

The next three columns (columns 7, 8, and 9 from the right) are the section for the whole number. The whole number, too, is set as far right within its own section as is possible. Notice then that each section is set off by the comma markers, and that the last column of each section is easily identifiable - a feature that is especially important when any part of a mixed number ends with a zero.

REDUCTION OF FRACTIONS

We will first consider the reduction of a fraction to its lowest term. When the numerator is smaller than the denominator, we proceed as follows.

6/9

1. Set the numerator (6) as far right in the numerator section as possible. (i.e. column 4 from the right).
2. Set the denominator (9) as far right in the denominator section as possible (i.e. column 1 from the right).
3. Divide the numerator (6) by the lowest common factor of both numerator and denominator (3); clear the numerator (6) and set the quotient (2) in its place.
4. Divide the denominator (9) by the lowest common factor (3); clear the denominator (9) and set the quotient (3) in its place.
5. The answer (2/3) is now shown on the abacus. (We know that the numerator is 2, and not 20, or 200, because the 2 is set on the column farthest right within the numerator section).

With larger fractions, such as $12/64$, we may first choose a common factor to divide by which is not the lowest possible, such as 2. If so, our resulting fraction $6/32$ will still not be in lowest terms. Thus we proceed by choosing a common factor of the resulting fraction $6/32$, and repeat the reduction process.

Reduce these fractions to lowest terms.

$$\begin{array}{llll}
 4/8 = 1/2 & 9/27 = 1/3 & 16/48 = 1/3 & 17/85 = 1/5 \\
 2/10 = 1/5 & 7/63 = 1/9 & 11/88 = 1/8 & 15/60 = 1/4 \\
 5/20 = 1/4 & 3/48 = 1/16 & 18/162 = 1/9 & 26/182 = 1/7 \\
 6/36 = 1/6 & 5/95 = 1/19 & 12/132 = 1/11 & 8/12 = 2/3 \\
 12/16 = 3/4 & 18/27 = 2/3 & 8/10 = 4/5 & 15/40 = 3/8 \\
 56/64 = 7/8 & 6/8 = 3/4 & 28/35 = 4/5 & 45/72 = 5/8
 \end{array}$$

If the numerator of a fraction is not smaller than the denominator, we follow the same procedure for reducing it to lowest terms, but then we must continue working to change it to a whole or mixed number. For instance, if we have the fraction $18/8$, we reduce it to $9/4$ by using the procedure already discussed. Having done so, we should have 9 set in the numerator section and 4 set in the denominator section. We then change the fraction to a mixed number by:

1. Divide the denominator (4) into the numerator (9); set the quotient (2) in the section for whole numbers, as far right in the section as is possible - (i.e. on column 7 from the right).
2. Multiply the quotient (2) times the denominator (4), Subtract the product (8) from the numerator (9)

3. The answer, $2 \frac{1}{4}$, is now shown on the abacus. (We know that the 2 is not 20, or 200 and that the one is not 10 or 100 because both numbers are written as far right within their own sections as possible.)

Reduce these fractions, then change them to whole or mixed numbers.

$$\frac{8}{6} = \frac{4}{3} = 1 \frac{1}{3}$$

$$\frac{28}{16} = \frac{7}{4} = 1 \frac{3}{4}$$

$$\frac{6}{2} = \frac{3}{1} = 3$$

$$\frac{55}{40} = \frac{11}{8} = 1 \frac{3}{8}$$

$$\frac{25}{5} = \frac{5}{1} = 5$$

$$\frac{72}{42} = \frac{12}{7} = 1 \frac{5}{7}$$

$$\frac{28}{5} = 5 \frac{3}{5}$$

$$\frac{60}{25} = \frac{12}{5} = 2 \frac{2}{5}$$

$$\frac{14}{4} = \frac{7}{2} = 3 \frac{1}{2}$$

$$\frac{84}{16} = \frac{21}{4} = 5 \frac{1}{4}$$

$$\frac{18}{16} = \frac{9}{8} = 1 \frac{1}{8}$$

$$\frac{45}{36} = \frac{5}{4} = 1 \frac{1}{4}$$

$$\frac{12}{10} = \frac{6}{5} = 1 \frac{1}{5}$$

$$\frac{95}{75} = \frac{19}{15} = 1 \frac{4}{15}$$

ADDITION OF FRACTIONS

Before we can begin to add any two (or more) fractions together, we must first choose a common denominator, preferably the lowest. Each fraction to be added, must first be changed to a fraction of equal value having that common denominator. The following example will show how this is done.

$$4 \frac{3}{5} + 5 \frac{2}{7} = 9 \frac{31}{35}$$

1. Set the common denominator (35) in the denominator section.
2. Set the whole number of the first number to be added (4) in the whole number section.

We must now change the $\frac{3}{5}$ to a fraction of equal value having the common denominator. To do so:

3. Set the numerator of the first fraction (3) on the far left column of the abacus.
4. Skip a column and on the next one set the denominator of the first fraction (5).
5. Divide the denominator of the first fraction (5) into the common denominator (35); then multiply that quotient (7) times the numerator of the first fraction (3); set the product (21) in the numerator section.
6. Clear the first fraction (3/5) from the left columns of the abacus.
7. Add the whole number of the second number (5) to whatever is already set in the whole number section (4).
8. Set the numerator of the second fraction (2) on the far left column of the abacus.
9. Skip a column and set the denominator of the second fraction (7).
10. Divide the denominator of the second fraction (7) into the common denominator (35); then multiply that quotient (5) times the numerator of the second fraction (2); and the product (10) to whatever is already set in the numerator section. (21)
11. Clear the second fraction (2/7) from the left columns of the abacus.
12. The answer (9 31/35) is now shown on the abacus.

If, after adding fractions, the numerator of the fraction in the answer is larger than the denominator as in $6 \frac{9}{7}$, then the fraction must be changed to a mixed number ($1 \frac{2}{7}$) in the manner discussed earlier, and the whole number part is added to whatever is already set in the whole number section - thus we would have $7 \frac{2}{7}$.

Add these fractions for practice.

$$\frac{1}{5} + \frac{3}{5} = \frac{4}{5}$$

$$\frac{7}{8} + \frac{2}{3} = \frac{37}{24} = 1 \frac{13}{24}$$

$$\frac{1}{3} + \frac{1}{4} = \frac{7}{12}$$

$$\frac{6}{2} \frac{9}{9} + 4 \frac{5}{6} = 10 \frac{19}{18} = 11 \frac{1}{18}$$

$$\frac{3}{5} + \frac{1}{6} = \frac{23}{30}$$

$$\frac{6}{5} \frac{8}{8} + 7 \frac{7}{12} = 13 \frac{29}{24} = 14 \frac{5}{24}$$

$$\frac{1}{3} + \frac{3}{8} = \frac{17}{24}$$

$$\frac{3}{13} \frac{16}{16} + 7 \frac{11}{32} = 10 \frac{37}{32} = 11 \frac{5}{32}$$

$$\frac{4}{2} \frac{7}{7} + \frac{4}{7} = 4 \frac{6}{7}$$

$$\frac{2}{5} \frac{7}{7} + 4 \frac{12}{21} = 6 \frac{27}{21} = 7 \frac{6}{21} = 7 \frac{2}{7}$$

$$\frac{7}{3} \frac{8}{8} + 2 \frac{5}{24} = 9 \frac{7}{12}$$

$$\frac{7}{11} \frac{18}{18} + 19 \frac{5}{6} = 16 \frac{26}{18} = 17 \frac{8}{18} = 17 \frac{4}{9}$$

$$\frac{3}{4} + \frac{2}{3} = \frac{17}{12} = 1 \frac{5}{12}$$

SUBTRACTION OF FRACTIONS

The procedure for subtracting fractions is exactly the same as for adding them except that, in addition, we added the second whole number and numerator to the first but in subtraction we subtract the second whole number and numerator from the first. It sometimes happens that the numerator of the first fraction is smaller than the second; and thus, the second can not be subtracted from it. When this occurs, we borrow 1 from the first whole number and change it to a fraction having whatever common denominator we have chosen. For example, if our common denominator is 4, we borrow 1 and change it to $4/4$ since $4/4$ equals 1. If the common denominator is 18, we change 1 to $18/18$.

Next we add the numerator of the fraction changed from 1 to the numerator of the first fraction, and then proceed with our subtraction of the second fraction. (Notice that we borrowed 1 from the first whole number and added it in fraction form to the first numerator. Thus we did not change the value of the first mixed number, only the form.)

Study the subtraction example below.

$$7 \frac{2}{9} - 1 \frac{5}{6} = 5 \frac{7}{18}$$

1. Set the common denominator (18) in the denominator section.
2. Set the whole number of the first number (7) in the whole number section.
3. Set the numerator of the first fraction (2) on the far left column of the abacus.
4. Skip a column and on the next one set the denominator of the first fraction. (9)
5. Divide the denominator of the first fraction (9) into the common denominator (18); then multiply that quotient (2) times the numerator of the first fraction (2); set the product (4) in the numerator section.
6. Clear the first fraction (2/9) from the left columns of the abacus.
7. Subtract the whole number of the second number (1) from the whole number of the first. (7)
8. Set the numerator of the second fraction (5) on the far left column of the abacus.

9. Skip one column, and on the next one set the denominator of the second fraction (6).

10. Divide the denominator of the second fraction (6) into the common denominator (18); multiply that quotient (3) times the numerator of the second fraction (5); the product should now be subtracted from the numerator of the first fraction, but in this case the first numerator is smaller, Thus

11. Borrow 1 from the whole number section by clearing it and changing it to a fraction with the common denominator (18/18) add the numerator to the numerator section.

12. Now subtract the numerator of the second fraction as found in step 10 (15).

13. The answer (5 7/18) is now shown on the abacus.

Work the following problems for practice in subtraction.

$$5/7 - 3/7 = 2/7$$

$$8 1/4 - 6 5/12 = 1 10/12 = 1 5/6$$

$$2 5/8 - 1 2/8 = 1 1/4$$

$$9 2/7 - 3 9/14 = 5 9/14$$

$$4/5 - 2/15 = 10/15 = 2/3$$

$$21 5/12 - 17 31/36 = 3 20/36 = 3 5/9$$

$$5 2/3 - 3 1/7 = 2 11/21$$

$$18 4/13 - 12 64/65 = 5 21/65$$

$$18 5/6 - 8 3/5 = 10 7/30$$

$$29 4/5 - 16 4/5 = 12 13/45$$

$$1 1/3 - 3/5 = 11/15$$

$$17 3/29 - 2 51/58 = 14 13/58$$

$$6 3/10 - 2 3/4 = 3 22/40 = 3 11/20$$

MULTIPLICATION OF FRACTIONS

At the beginning of this chapter on fractions we noted that when reducing, adding, or subtracting either fractions or mixed numbers, we divide the abacus into three sections. Now we are ready to consider multiplication and division of fractions and mixed numbers; and when this is done, the abacus is divided into two sections, one being the left side for the numerators and the other being the right side for the denominators. The numerators are set as far left as possible with one empty column separating them. The denominators are set as far right as possible, again with one vacant column separating them. And as you know, to multiply two fractions we multiply one numerator times the other and the product becomes the numerator of the answer. Then we multiply one denominator times the other and the product becomes the denominator of the answer. Sometimes, of course, the answer must be reduced.

Study the following example. Remember to set and clear numbers with the proper fingers.

$$4/7 \times 5/9 = 20/63$$

1. Set the numerator of the first fraction (4) on the column farthest left.
2. Set the denominator of the first fraction (7) on the column farthest right.
3. Leave one column vacant to the right of the first numerator, and set the numerator of the second fraction (5) on the next column to the right.
4. Leave one column vacant to the left of the first denominator

and set the denominator of the second denominator (9) on the next column to the left.

5. Now multiply the first numerator (4) times the second (5), clear the numerators, then set the product (20) so that the last digit is on the fourth column from the left edge of the abacus. Notice that there is a comma marker just to the right of this column - thus the position of the last digit is easily identifiable and numbers ending in zero should not be misread.
6. Next multiply the first denominator (7) times the second (9); clear both denominators, then set the product (63) so that the last digit is on the column farthest right.
7. The answer, (20/63) is now shown on the abacus.

Multiply these fractions for practice. Reduce the answers if necessary.

$$\frac{5}{6} \times \frac{3}{4} = \frac{15}{24} = \frac{5}{8}$$

$$\frac{3}{5} \times \frac{1}{3} = \frac{3}{15} = \frac{1}{5}$$

$$\frac{1}{3} \times \frac{2}{3} = \frac{2}{9}$$

$$\frac{7}{9} \times \frac{6}{7} = \frac{42}{63} = \frac{6}{9} = \frac{2}{3}$$

$$\frac{7}{8} \times \frac{2}{5} = \frac{14}{40} = \frac{7}{20}$$

$$\frac{1}{12} \times \frac{1}{4} = \frac{1}{48}$$

$$\frac{4}{7} \times \frac{9}{10} = \frac{36}{70} = \frac{18}{35}$$

$$\frac{4}{5} \times \frac{4}{9} = \frac{16}{45}$$

$$\frac{5}{12} \times \frac{1}{2} = \frac{5}{24}$$

$$\frac{1}{6} \times \frac{3}{8} = \frac{3}{48}$$

$$\frac{4}{15} \times \frac{2}{3} = \frac{8}{45}$$

$$\frac{5}{11} \times \frac{2}{3} = \frac{10}{33}$$

We have noted that in multiplication and division, there is no section for whole numbers. However, we are still able to multiply mixed numbers on the abacus. To do so we simply change the mixed

numbers to improper fractions then set and work them as we did the fractions in the last group of exercises. Do these problems for practice. Reduce and change the answers to mixed numbers if necessary.

$$1 \frac{1}{3} \times 4 \frac{2}{5} = \frac{4}{2} \times \frac{22}{5} = \frac{88}{15} = 5 \frac{13}{15}$$

$$2 \frac{2}{3} \times 1 \frac{1}{4} = \frac{8}{3} \times \frac{5}{4} = \frac{40}{12} = \frac{10}{3} = 3 \frac{1}{3}$$

$$\frac{5}{9} \times 5 \frac{1}{2} = \frac{5}{9} \times \frac{11}{2} = \frac{55}{18} = 3 \frac{1}{18}$$

$$4 \frac{2}{3} \times 2 = \frac{14}{3} \times \frac{2}{1} = \frac{28}{3} = 9 \frac{1}{3}$$

$$2 \frac{1}{6} \times 1 \frac{1}{4} = \frac{13}{6} \times \frac{5}{4} = \frac{65}{24} = 2 \frac{17}{24}$$

CANCELLATION

One other process sometimes used in multiplication (and division) is the process of cancellation, i.e. when some number can be divided evenly into one of the numerators and one of the denominators.

Study this example to see how this process is done on the abacus.

$$1 \frac{5}{7} \times 2 \frac{2}{3} = \frac{12}{7} \times \frac{2}{3} = \frac{4}{7} \times \frac{2}{1} = \frac{8}{7} = 1 \frac{1}{7}$$

1. Set the numerator of the first fraction (12).
2. Set the denominator of the first fraction (7).
3. Set the numerator of the second fraction (2).
4. Set the denominator of the second fraction (3).
5. Place the left hand on the first numerator (12). With the right hand check the left-most denominator (3). We find that the number 3 can be divided evenly into both.

Thus

6. Divide 3 into the first numerator (12); with the right hand clear the first numerator (12) and set the quotient (4) in its place.
7. Divide the 3 into the left-most denominator, clear that denominator and set the quotient (1) in its place.
8. Now with the left hand again on the first numerator (4), check the far right denominator (7); there is no number that will cancel into them evenly.
9. Next place the left hand on the second numerator (2); with the right hand check the far-left denominator (1), again there is no number that will cancel.
10. With the left hand still on the second numerator (2), check the far-right denominator (7); once again there is no number that can be divided evenly into both numbers.

Now we have completed cancellation. From this point, the multiplication procedure continues as before. Work these problems for practice. Be sure to cancel whenever possible and to reduce the final answers and change them to mixed numbers when necessary.

$$\frac{3}{4} \times \frac{8}{11} = \frac{3}{1} \times \frac{2}{11} = \frac{6}{11}$$

$$\frac{1}{9} \times \frac{3}{5} = \frac{1}{3} \times \frac{1}{5} = \frac{1}{15}$$

$$\frac{4}{7} \times \frac{1}{12} = \frac{1}{7} \times \frac{1}{3} = \frac{1}{21}$$

$$1 \frac{3}{7} \times \frac{5}{6} = \frac{10}{7} \times \frac{5}{6} = \frac{5}{7} \times \frac{5}{3} = \frac{25}{21} = 1 \frac{4}{21}$$

$$1 \frac{7}{8} \times 1 \frac{1}{3} = \frac{15}{8} \times \frac{4}{3} = \frac{5}{2} \times \frac{1}{1} = \frac{5}{2} = 2 \frac{1}{2}$$

$$1 \frac{4}{5} \times 2 \frac{1}{12} = \frac{9}{5} \times \frac{25}{12} = \frac{2}{1} \times \frac{5}{4} = \frac{15}{4} = 3 \frac{3}{4}$$

$$2 \frac{5}{8} \times 1 \frac{5}{7} = \frac{21}{8} \times \frac{12}{7} = \frac{3}{2} \times \frac{3}{1} = \frac{9}{2} = 4 \frac{1}{2}$$

$$1 \frac{7}{9} \times 2 \frac{7}{10} = \frac{16}{9} \times \frac{27}{10} = \frac{8}{1} \times \frac{3}{5} = \frac{24}{5} = 4 \frac{4}{5}$$

DIVISION OF FRACTIONS

To divide one fraction by another, we simply invert the divisor, and multiply in the manner already learned. In other words, in the problem $2/3 \div 1/5$ = we simply invert the divisor and multiply. i.e. $2/3 \times 5/1 = 10/3 = 3 \frac{1}{3}$. As in multiplication, we must sometimes change mixed numbers to improper fractions. We are oftentimes able to cancel, and we frequently find it necessary to reduce the answers and/or change them to mixed numbers. Since we have already dealt with all of these processes when considering multiplication, we will not discuss them again here. However, you will need to use them in solving the following problems:

$$\frac{4}{5} \div \frac{3}{7} = \frac{4}{5} \times \frac{7}{3} = \frac{28}{15} = 1 \frac{13}{15}$$

$$\frac{5}{8} \div \frac{1}{3} = \frac{5}{8} \times \frac{3}{1} = \frac{15}{8} = 1 \frac{7}{8}$$

$$\frac{7}{9} \div \frac{2}{5} = \frac{7}{9} \times \frac{5}{2} = \frac{35}{18} = 1 \frac{17}{18}$$

$$\frac{3}{4} \div \frac{5}{6} = \frac{3}{4} \times \frac{6}{5} = \frac{18}{20} = \frac{9}{10}$$

$$\frac{2}{3} \div \frac{5}{7} = \frac{2}{3} \times \frac{7}{5} = \frac{14}{15}$$

$$1 \frac{5}{7} \div 4 \frac{1}{2} = \frac{12}{7} \div \frac{9}{2} = \frac{12}{7} \times \frac{2}{9} = \frac{24}{63} = \frac{8}{21}$$

$$1 \frac{7}{8} \div 1 \frac{1}{2} = \frac{15}{8} \div \frac{3}{2} = \frac{15}{8} \times \frac{2}{3} = \frac{5}{4} \times \frac{1}{1} = \frac{5}{4} = 1 \frac{1}{4}$$

$$1 \frac{5}{12} \div 2 \frac{5}{6} = \frac{17}{12} \div \frac{17}{6} = \frac{17}{12} \times \frac{6}{17} = \frac{1}{2} \times \frac{1}{1} = \frac{1}{2}$$

$$3 \frac{1}{8} \div 1 \frac{1}{4} = \frac{25}{8} \div \frac{5}{4} = \frac{25}{8} \times \frac{4}{5} = \frac{5}{2} \times \frac{1}{1} = \frac{5}{2} = 2 \frac{1}{2}$$

$$3 \frac{1}{9} \div 1 \frac{11}{21} = \frac{28}{9} \div \frac{32}{21} = \frac{28}{9} \times \frac{21}{32} = \frac{7}{3} \times \frac{7}{8} = \frac{49}{24} = 2 \frac{1}{24}$$

$$3 \frac{3}{5} \div 1 \frac{6}{15} = \frac{18}{5} \div \frac{21}{15} = \frac{18}{5} \times \frac{15}{21} = \frac{6}{1} \times \frac{3}{7} = \frac{18}{7} = 2 \frac{4}{7}$$

EXTRACTION OF ROOTS

To describe the complete process for extracting roots would necessitate considerable arithmetical instruction as well as a good deal of space, because the computations are rather involved and will likely require the use of more than one abacus. I feel it is impractical to explain the procedure here.

If you have available a table of logarithms, extracting roots becomes much simpler. Study the example below to learn exactly how such extractions are done.

To find the square root of 144

1. Find the logarithm (1584) of the number whose root you want to extract (144).
2. Divide that logarithm (1584) by the number of the root (2).
3. Read the quotient (792); find that quotient in the logarithm table; it will be the logarithm of the answer you are seeking (12).

With the aid of a logarithm table, extract the requested roots from these numbers.

square root of 121 = 11

cube root of 1331 = 11

square root of 196 = 14

cube root of 2197 = 13

square root of 100 = 10

cube root of 1000 = 10

square root of 169 = 13

cube root of 1728 = 12

square root of 184 = 13.565

fourth root of 10000 = 10

square root of 137 = 11.705

fourth root of 38416 = 14

square root of 154 = 12.410

Tables of logarithms are available in Braille from the American Printing House for the Blind, 1839 Frankfort Avenue, Louisville, 6, Kentucky.

CONCLUSION

On the preceding pages we have discussed the arithmetical process of addition, multiplication, subtraction, and division, as well as work with fractions and the extraction of roots. Naturally, the mathematical examples and exercises in this book are quite elementary since the purpose was to teach you how to use the abacus and not how to solve problems of higher math. Blind students who learn to use the abacus should not, however, assume that their abacus can be used to solve only the simplest problems of addition, subtraction, multiplication, or division. It should be obvious that these elementary processes are, in fact, used in all types of higher mathematics from geometry to calculus and that wherever these processes are employed, the abacus will continue to be useful. Of course, the braillewriter or slate and stylus will be necessary to record intermediate answers and final solutions, but the abacus will remain the quickest and most effective means for finding those answers.
